

ABSTRACT

A marine steam turbine module structure includes a steam turbine, a generator driven by
5 the steam turbine, a condenser for condensing steam discharged downward from the steam
turbine, and a base on which the steam turbine, the generator, and the condenser are disposed.
The base has a two-floor structure including an upper plate and a lower plate. The steam
turbine and the generator are disposed on the upper plate, and the condenser is disposed on the
lower plate so that the steam turbine, the generator, the condenser, and the base are
10 modularized.
