

ABSTRACT

Provided is a resin cap that is less likely to cause inward collapsing of a container mouth part whose front end part has a reduced thickness even
5 when the resin cap is attached to such a container mouth part. A resin cap (10) is to be attached to a container mouth part (20) and includes a top plate part (11), a tubular part (12) that extends downward from a circumferential edge of the top plate part (11), an outer ring (13) that is formed on an inner surface of the top plate part (11) and is capable of coming into contact with an
10 outer circumferential surface of the container mouth part (20), and an inner ring (14a) that is formed on the inner surface of the top plate part (11) and is capable of coming into contact with an inner circumferential surface of the container mouth part (20), and the inner ring (14a) is capable of coming into contact with a thin part (20a) that is formed at a front end part of the
15 container mouth part (20).
