What is claimed is:

1. A fill-in form providing device comprising:

a transmission section that transmits information of a user interface for a fill-in form to an image forming device of an acquisition request source in response to an acquisition request to acquire the user interface for the fill-in form issued from the image forming device;

a printing instruction section that instructs the image forming device of a printing request source to print a fill-in form associated with the user interface for the fill-in form, in response to a printing request to print the fill-in form based on an operation of the user interface for the fill-in form in the image forming device;

a reception section that receives image data, which is generated through image reading based on the operation of the user interface for the fill-in form in the image forming device, and storage destination information which represents a storage destination of the image data; and

a storage processing section that executes processing for storing the image data in the storage destination.

2. The fill-in form providing device according to claim 1,

wherein an image reading condition is associated with the user interface for the fill-in form, and

the image reading based on the operation of the user interface for the fill-in form is executed in accordance with the image reading condition.

3. The fill-in form providing device according to claim 2,

wherein the image reading condition includes a sheet number condition for the image reading.

4. The fill-in form providing device according to claim 3,

wherein the number of sheets indicated by the sheet number condition is equal to the number of sheets of the fill-in form which is printed in accordance with the print instruction.

5. The fill-in form providing device according to claim 3, further comprising:

an output section that when the number of sheets of an original document read by the

image forming device is not equal to the number of sheets indicated by the sheet number condition, outputs information indicating the numbers of sheets are not equal.

6. The fill-in form providing device according to claim 1,

wherein the printing instruction section acquires information about a user who issues an instruction of the printing request, and issues the instruction to print the fill-in form into which the information about the user is filled.

7. The fill-in form providing device according to claim 1,

wherein the user interface for the fill-in form includes a user interface for printing and a user interface for image reading,

the printing request is executed on the basis of an operation of the user interface for printing, and

the image reading is executed on the basis of an operation of the user interface for image reading.

8. The fill-in form providing device according to claim 7,

wherein the transmission section includes

a first transmission section that transmits information of the user interface for printing, to an image forming device of a first acquisition request source, in response to a first acquisition request to acquire the user interface for the fill-in form, and

a second transmission section that transmits information of the user interface for image reading, to an image forming device of a second acquisition request source, in response to a second acquisition request to acquire the user interface for image reading.

9. The fill-in form providing device according to claim 8,

wherein the second transmission section transmits the information of the user interface for image reading to the image forming device of the second acquisition request source in response to receiving printing completion information indicating a state where the printing of the fill-in form is completed in the image forming device.

10. The fill-in form providing device according to claim 9, further comprising:

a storage section that receives user identification information, which is for identifying

the user who issues an instruction of the printing request, and the printing completion information, and stores the user identification information and the printing completion information in association with each other,

wherein the second transmission section transmits the information of the user interface for image reading to the image forming device of the second acquisition request source in response to receiving the user identification information, which is stored in the storage section, from the image forming device of the second acquisition request source.

11. The fill-in form providing device according to claim 8,

wherein the image forming device of the first acquisition request source is the same as the image forming device of the second acquisition request source.

12. The fill-in form providing device according to claim 8,

wherein the image forming device of the first acquisition request source is different from the image forming device of the second acquisition request source.

13. An image forming device comprising:

a display control section that causes a display section to display a user interface for a fill-in form which is provided from a fill-in form providing device;

a printing request section that requests the fill-in form providing device to print the fill-in form associated with the user interface for the fill-in form in accordance with a printing instruction based on an operation of the user interface for the fill-in form;

a printing section that prints the fill-in form in accordance with an instruction to print the fill-in form corresponding to the request;

an image reading section that reads an image of an original document including the fill-in form so as to generate image data in accordance with an image reading instruction based on the operation of the user interface for the fill-in form; and

a transmission section that transmits the image data and image data storage destination information, which are associated with the user interface for the fill-in form, to the fill-in form providing device.

14. The image forming device according to claim 13,

wherein an image reading condition is associated with the user interface for the fill-in

form, and

the image reading section reads an image of the original document including the fill-in form in accordance with the image reading condition.

15. The image forming device according to claim 14,

wherein the image reading condition includes a sheet number condition for the image reading, and

the image reading section reads images of the number of sheets of the original document indicated by the sheet number condition.

16. The image forming device according to claim 15,

wherein the number of sheets indicated by the sheet number condition is equal to the number of sheets of the fill-in form which is printed in accordance with the printing instruction.

17. The image forming device according to claim 15, further comprising:

an output section that when the number of sheets of an original document read by the image reading section is not equal to the number of sheets indicated by the sheet number condition, outputs information indicating the numbers of sheets are not equal.

18. The image forming device according to claim 13, further comprising:

a user information receiving section that receives user information,

wherein the printing section prints the fill-in form into which the received user information is filled.

19. The image forming device according to claim 13,

wherein the user interface for the fill-in form includes a user interface for printing and a user interface for image reading,

the printing request section requests the fill-in form providing device to print the fill-in form in accordance with the printing instruction based on the operation of the user interface for printing,

after the fill-in form is printed by the printing section, the display control section causes the display section to display the user interface for image reading, and

the image reading section reads the image of the original document including the fill-

in form in accordance with the image reading instruction based on the operation of the user interface for image reading.

20. A fill-in form providing method, comprising:

transmitting information of a user interface for a fill-in form to an image forming device of an acquisition request source in response to an acquisition request to acquire the user interface for the fill-in form issued from the image forming device;

instructing the image forming device of a printing request source to print a fill-in form associated with the user interface for the fill-in form, in response to a printing request to print the fill-in form based on an operation of the user interface for the fill-in form in the image forming device;

receiving image data, which is generated through image reading based on the operation of the user interface for the fill-in form in the image forming device, and storage destination information which represents a storage destination of the image data; and

executing processing for storing the image data in the storage destination.

21. An image forming method, comprising:

causing a display section to display a user interface for a fill-in form which is provided from a fill-in form providing device;

requesting the fill-in form providing device to print the fill-in form associated with the user interface for the fill-in form in accordance with a printing instruction based on an operation of the user interface for the fill-in form;

printing the fill-in form in accordance with an instruction to print the fill-in form corresponding to the request;

reading an image of an original document including the fill-in form so as to generate image data in accordance with an image reading instruction based on the operation of the user interface for the fill-in form; and

transmitting the image data and image data storage destination information, which are associated with the user interface for the fill-in form, to the fill-in form providing device.

22. A non-transitory computer readable medium storing a program causing a computer to execute a process for fill-in form providing, the process comprising:

transmitting information of a user interface for a fill-in form to an image forming

device of an acquisition request source in response to an acquisition request to acquire the user interface for the fill-in form issued from the image forming device;

instructing the image forming device of a printing request source to print a fill-in form associated with the user interface for the fill-in form, in response to a printing request to print the fill-in form based on an operation of the user interface for the fill-in form in the image forming device;

receiving image data, which is generated through image reading based on the operation of the user interface for the fill-in form in the image forming device, and storage destination information which represents a storage destination of the image data; and

executing processing for storing the image data in the storage destination.

23. A non-transitory computer readable medium storing a program causing a computer to execute a process for image forming, the process comprising:

causing a display section to display a user interface for a fill-in form which is provided from a fill-in form providing device;

requesting the fill-in form providing device to print the fill-in form associated with the user interface for the fill-in form in accordance with a printing instruction based on an operation of the user interface for the fill-in form;

printing the fill-in form in accordance with an instruction to print the fill-in form corresponding to the request;

reading an image of an original document including the fill-in form so as to generate image data in accordance with an image reading instruction based on the operation of the user interface for the fill-in form; and

transmitting the image data and image data storage destination information, which are associated with the user interface for the fill-in form, to the fill-in form providing device.
