

HOLDING TABLE

ABSTRACT OF THE DISCLOSURE

A holding table includes a holding plate that has a holding surface for holding a workpiece and a base to which the holding plate is detachably mounted. The base has a hook erected from an upper surface thereof, whereas the holding surface has, in a lower surface thereof, a recess for engagement with the hook. The holding plate and the base, with the hook accommodated in the recess, are relatively rotated around an axis from a state of being obliquely deviated in plane directions into an overlapping positional relation, to thereby fit the recess to the hook and fix the holding plate to the base.
