(54) Title: MECHANISM FOR FILE TRANSFORMATION AND SHARING ACROSS DEVICES USING CAMERA INTERFACE

FIG. 1

(57) Abstract: Embodiments described herein relate generally to the transmission of a request for a file from a first computing device to a second computing device. The first computing device may present an image having a representation of a file to a user and detect a selection of a location on the image at which the representation of the file is disposed. The first computing device, in turn, may transmit the image and a description of the selection to the second computing device. Based on the received image and description of the selection, the second computing device may identify the file corresponding to the selected location on the image. The second computing device may adapt, or cause to be adapted, the identified file. The second computing device may then transmit the identified file (or the adapted version) to the first computing device. Other embodiments may be described and/or claimed.
