

ABSTRACT

The present invention relates to a method and a system for providing a medical service, and a non-transitory
5 computer-readable recording medium. One aspect of the present invention provides a method for providing a medical service, the method comprising the steps of: determining a state of a patient within a hospital that the patient visits and a medical service needed for the patient, by making
10 reference to information on the location and a medical appointment or an electronic medical record (EMR) of the patient; and dynamically matching the patient with at least one medical team or assistant medical team belonging to the hospital, by making reference to information on at least one
15 of the state of the patient within the hospital, the medical service needed for the patient, a state of the medical team or assistant medical team within the hospital, and a medical service which can be provided by the medical team or assistant medical team.
