

ABSTRACT

This disclosure relates to a facial expression-based unlocking method and apparatus, a computer device, and a storage medium. The method includes: displaying an expression unlock page (S202); displaying an unlock node sequence on the expression unlock page (S204); creating, at a to-be-processed unlock node in the unlock node sequence, an unlock status identification based on a facial expression in a facial image captured in real time (S206); and completing unlocking based on the unlock status identification and match between the facial expression in the facial image and a corresponding target expression (S208).
