(54) Title: OUTSIDE LIVE MIGRATION

FIG. 6

(57) Abstract: Global remappable addresses can be announced from multiple points across the Internet or other public networks. A global address can be mapped to one or more internal addresses for a provider, such that when traffic is received to a network location the provider can determine whether the traffic is to be processed in the current network location or a different network location, as may be determined using a static process or a dynamic process based on any of a number of factors. If the traffic is destined for a different network location, the traffic can be remapped and forwarded to that network location. Once the traffic is in the determined destination network location, the traffic can be remapped and delivered to the ultimate destination. The remappings and destination network locations can be adjusted at any time, based on any of a number of factors, without significant risk of dropping traffic.
