ABSTRACT

For conventional panels in which side edges of a plurality of panels are connected through a connecting member having a plurality of connecting faces, a cover mounted for

5 covering an unused face of the connecting member is quite different from a cover mounted on a side end face of the above-mentioned panel, thereby to increase a load in production, a number of component parts and a cost. As a result, in case that side edges of a plurality of movable

10 partition walls 1 are connected through a connecting member 6 having a plurality of connecting faces 6a, a cover 7 which covers a side end face 1a of the movable partition wall 1 is so arranged that it can be commonized as a cover which covers an unused connecting face 6a of the connecting

15 member 6.
