TRANSACTION SUPPORT SYSTEM

ABSTRACT

Generation rule storage part stores a correspondence between a data item of order slip data and a data item of delivery slip data. Transaction information storage part stores the order slip data and the delivery slip data as transaction information. The transaction information processing part automatically generates delivery slip data from order slip data for a transaction between the traders based on the correspondence stored in the generation rule storage part, and stores the delivery slip data in the transaction information storage part. The transaction information processing part uses trader identifiers of a seller and a buyer provided in the automatically generated delivery slip data to automatically generate transaction traceability information for each transaction or for each package of the transaction by associating the trader identifiers of the seller and the buyer with each other, and stores the generated traceability information as the transaction information.
