ABSTRACT

A method for terminating wireless local area network (WLAN) sensing measurement setup is performed by a sensing initiator, and includes: determining a sensing measurement setup termination frame, in which the sensing measurement setup termination frame includes at least one of a first identification bit or a second identification bit, the first identification bit indicates a termination range of a sensing measurement process to be terminated at a request of the sensing initiator, and the second identification bit indicates a trigger type of the sensing measurement process to be terminated at the request of the sensing initiator; and transmitting the sensing measurement setup termination frame.
