(54) Title: SURGICAL SAW FOR CUTTING OFF JAWBONE

(57) **Abstract:** The surgical saw for cutting off a jawbone includes a shank which includes a straight line portion having a rear end fixed by a jaw of a handle, and a curved portion extended at a certain deflection angle in a certain direction between left and right directions and a lower direction from a front end of the straight line portion, and a toothed portion in which teeth are arranged in parallel with respect to the straight line portion and engaged to a front end of the curved portion of the shank. In the present invention, the jawbone is cut at a slanted angle which is parallel with respect to the front surface based on one time cutting operation by directly checking the cut portions and the contour line of the jaw for thereby implementing a natural appearance of the jaw at a short time.
