

Automatic Monitoring Of Motionless Object And Animate Body

ABSTRACT

[0053] The present invention provides a method (100) of monitoring a motionless object/animate body in a security surveillance or nursing system. The method (100) involves determining that the object/body is foreign to an area A under monitor and then determining that there are no significant changes between changed images. In addition to a two-level image analysis, the method (100) further differentiates a motionless animate body from an object in a changed image.
