

ABSTRACT

MASSAGE DEVICE

The present invention is intended to provide a massage device capable of retaining a good massage effect while an attitude of a massage member is hardly to change even in the case where the massage member is movably provided in the back and forth direction. A massage device 1 includes: a first massage member 5 having a first treating tip 7 provided at its distal end; a second massage member 6 having a second treating tip 8 provided at its distal end; and a massage mechanism for swinging the first massage member 5 and the second massage member 6. In this arrangement, the massage mechanism is provided in a forward protruded position with respect to the first treating tip 7 and includes a third treating tip 40 provided in a laterally outer side and in an upper side with respect to the first treating tip 7.
