TITLE OF INVENTION: ARRANGEMENT FOR BLOCKING OR UNBLOCKING A FLOW OF FLUIDS

Abstract

The invention relates to an arrangement (A) for blocking or unblocking a flow of fluids through a component (1) conducting the fluid from a high pressure side to a low pressure side, said component delimiting a fluid passage (F), wherein the arrangement comprises

- the component (1) which conducts the fluid,
- a bursting disk (2) as a means for closing the fluid passage through the component (1), said bursting disk separating the high pressure side and the low pressure side, wherein the bursting disk (2) is at least indirectly attached to the component (1), and
- a controllable actuator (3) which is actuatable for unblocking the fluid passage.
