

THERMOSETTING RESIN COMPOSITION

ABSTRACT

5 An object of the present invention is to provide a cyanate ester-based curable resin
composition having a high curing rate, very high heat resistance and very high long-term heat
resistance, and a molded article and a prepreg each using the same. The present invention relates
to a thermosetting resin composition including (A) a cyanate ester compound and/or (B) an
unsaturated imide compound, and (C) a cyclic carbodiimide compound. In addition, the present
10 invention relates to a molded article including a cured product of the thermosetting resin
composition, and a prepreg including a reinforcing fiber substrate impregnated with the
thermosetting resin composition.
