

SORTING SYSTEM AND SORTING METHOD

Abstract

To enable an operator to recognize arrival of a sorting target article, even while the operator is away from an operation
5 area. A first control section (12) of a control device (1) determines a sorting destination on the basis of identification information that has been read by a reading device (3), and causes a first wireless communication section (11) to transmit information on reception of an article to a mobile terminal (2)
10 that is associated with the determined sorting destination. A second control section (22) of the mobile terminal (2) causes a notification section (24, 26, 27) to notify an arrival timing at which the article is to arrive at the sorting destination, on the basis of the information on the reception of the article which
15 has been received by a second wireless communication section (21).
