

## Abstract

### PAPER CONTAINER

Provided is a paper container, which is capable of preventing slippage at the time of grabbing the paper container to provide ease of holding and is less liable to adversely affect, for example, storage and conveyance. The paper container includes a body front panel (5), a body left side panel (6), a body right side panel (8), and a body back panel (7), which are contiguous through body vertical folding lines (1), (2), (3), and (4). A vertical direction sealing panel (25) is configured to form a quadrangular tubular body (26). The body vertical folding line (1) through which the body front panel (5) and the body right side panel (8) are contiguous with each other and the body vertical folding line (2) through which the body front panel (5) and the body left side panel (6) are contiguous with each other are approximately symmetrical bent lines bent toward a center of the body front panel (5), and the body vertical folding line (3) through which the body back panel (7) and the body left side panel (6) are contiguous with each other and the body vertical folding line (4) through which the body back panel (7) and the body right side panel (8) are contiguous with each other are approximately symmetrical bent lines bent toward a center of the body back panel (7).
