

ABSTRACT

FLOW CELL FOR USE IN A FLUID MANAGEMENT AND/OR PROCESSING SYSTEM

The present invention relates to a flow cell for use in a fluid management and/or processing system, said flow cell comprising a body having an inlet and an outlet and a fluid flow channel extending from the inlet to the outlet of the body. Said body further comprises a receptacle comprising a chamber forming a part of the fluid flow channel of the body, said chamber comprising a first opening for connecting a functional element to the flow cell such that the functional element is in contact with or exposed to a fluid flow passing through the fluid flow channel. A first tubular connector is arranged adjacent to the inlet of the body. A second tubular connector is arranged adjacent to the outlet of the body. The flow cell further comprises a functional element and a fluid flow path extending from the first tubular connector through the inlet of the body, the body and its receptacle to the outlet of the body to the second tubular connector. The invention further relates to fluid management and/or processing systems comprising a tubing arrangement and one or more flow cells.
