

A WALL MOUNTABLE SHOWER HEAD

ABSTRACT

A wall mountable shower head directly mountable to a vertical wall comprising:
a 3 dimensional body member having a planar external surface for engagement with the vertical wall and a wall projecting external surface. At least one conduit extends through the 3 dimensional body, the outlet provided at the wall projecting external surface to in use project water through the outlet in a downward direction. A lower region of the wall projecting external surface, intermediate of the at least one outlet and the planar external surface, is a region of the wall projecting external surface along which water can naturally flow from the at least one outlet to the interface of the wall projecting external surface and the planar external surface, but it is provided with a drip channel or relief extending lateral to the direction of any such natural flow to release any such natural flow from the wall projecting surface.
