CLAIMS

What is claimed is:

1. A method of identifying a plurality of cognate pairs comprising a first polypeptide and a second polypeptide that form an adaptive immune receptor heterodimer, said adaptive immune receptor heterodimer comprising a T cell receptor (TCR) or Immunoglobulin (IG) from a single clone in a sample, said sample comprising a plurality of lymphoid cells from a mammalian subject, said method comprising:

distributing a plurality of lymphoid cells among a plurality of containers, each container comprising a plurality of lymphoid cells;

generating a library of amplicons in said plurality of containers by performing multiplex PCR of cDNA molecules that have been reverse-transcribed from mRNA molecules obtained from said plurality of lymphoid cells, said library of amplicons comprising:

i) a plurality of first adaptive immune receptor amplicons encoding said first polypeptide, each comprising a unique variable (V) region encoding sequence, a unique J region encoding sequence or both a unique J region encoding sequence and a unique C region encoding sequence, at least one barcode sequence, at least one universal adaptor sequence, and a sequencing platform tag sequence, and

ii) a plurality of second adaptive immune receptor amplicons encoding said second polypeptide, each comprising a unique V region encoding sequence, a unique J region encoding sequence or both a unique J region encoding sequence and a unique C region encoding sequence, at least one barcode sequence, at least one universal adaptor sequence, and a sequencing platform tag sequence;

performing high throughput sequencing of said library of amplicons to obtain a data set of a plurality of first and second adaptive immune receptor amplicon sequences;

determining a container occupancy pattern for each unique first adaptor immune receptor amplicon sequence by assigning each unique first adaptor immune receptor amplicon sequence to one or more containers, and a container occupancy pattern for each unique second adaptor immune receptor amplicon

sequence by assigning each unique second adaptor immune receptor amplicon sequence to one or more containers, wherein each barcode sequence in said unique first or second adaptor immune receptor amplicon sequences is associated with a particular container;

for each possible pairing of a unique first and second adaptive immune receptor amplicon sequence to form a putative cognate pair, calculating a statistical probability of observing said container occupancy patterns, or observing any larger proportion of shared containers than expected by chance, given that said first and second adaptor immune receptor amplicon sequences do not originate from the same clonal population of lymphoid cells;

identifying a plurality of a putative cognate pairs based on said statistical probability having a score lower than a predetermined likelihood cutoff;

for each identified putative cognate pair, determining a false discovery rate estimation for a possible false pairing of said unique first adaptor immune receptor amplicon sequence and said unique second adaptor immune receptor amplicon sequence; and

identifying a plurality of cognate pairs of unique first and second adaptive immune receptor sequences as true cognate pairs that encode said adaptive immune receptors in said sample based on said statistical probability and said false discovery rate estimation.

2. The method of claim 1, wherein said statistical score comprises a p-value calculated for pairing each putative cognate pair of unique first and second adaptive immune receptor amplicon sequences.

3. The method of claim 2, wherein calculating said statistical score comprises calculating a probability that said unique first and second adaptive immune receptor amplicon sequences should jointly occupy as many or more containers than they are observed to jointly occupy, assuming no true cognate pairing and given the number of containers occupied by said unique first adaptive immune receptor amplicon sequence and the number of containers occupied by said unique second adaptive immune receptor amplicon sequence.

4. The method of claim 2, wherein identifying a plurality of a putative cognate pairs that have a high likelihood of pairing based on said statistical probability comprises for each unique first adaptor immune receptor amplicon sequence identifying the unique second

adaptor immune receptor amplicon sequence that has the lowest p-value score of matching, or for each unique second adaptor immune receptor amplicon sequence finding the unique first adaptor immune receptor amplicon sequence that has the lowest p-value score of matching.

5. The method of any one of claims 2-4, wherein determining a false discovery rate estimation comprises:

calculating p-values for each of said plurality of putative cognate pairs identified in said sample;

comparing the p-values for all of said plurality of putative cognate pairs with an expected p-value distribution, said expected p-value distribution calculated to represent an experiment where no true cognate pairs are present; and

determining for each putative cognate pair, an expected proportion of false positive results such that all p-values at or below the p-value of said putative cognate pair are determined to represent a true cognate pairing.

6. The method of claim 4, wherein calculating said expected p-value distribution comprises:

permuting the containers in which each first and second adaptive immune receptor sequence has been observed in an otherwise-identical experiment with no true cognate pairs, and

calculating the distribution of p-values associated with each putative cognate pair.

7. The method of claim 5, further comprising identifying a plurality of cognate pairs of unique first and second adaptive immune receptor sequences as true cognate pairs by selecting a plurality of putative cognate pairs that have p-values below a threshold calculated based on said false discovery rate estimation.

8. The method of claim 7, wherein an identified cognate pair of unique first and second adaptive immune receptor amplicon sequences have a false discovery rate estimation of less than 1%.

9. The method of claim 1, further comprising:

contacting each of said plurality of containers, under conditions and for a time sufficient to promote reverse transcription of mRNA molecules obtained from said plurality of lymphoid cells, with a first reverse transcription primer set, wherein (A) said first oligonucleotide reverse transcription primer set comprises primers capable of reverse transcribing a plurality of mRNA

sequences encoding said plurality of first and second adaptive immune receptor polypeptides for generating a plurality of first and second reverse-transcribed adaptive immune receptor cDNA amplicons,

wherein said plurality of first reverse-transcribed adaptive immune receptor cDNA amplicons encoding said first adaptive immune receptor polypeptide comprise 1) a unique V region encoding gene sequence, and 2) a unique J region encoding gene sequence or both a unique J region encoding gene sequence and a unique C region encoding gene sequence, and

wherein said plurality of second reverse-transcribed adaptive immune receptor cDNA amplicons encoding said second adaptive immune receptor polypeptide comprise 1) a unique V region encoding gene sequence, and 2) a unique J region encoding gene sequence or both a unique J region encoding gene sequence and a unique C region encoding gene sequence.

10. The method of claim 9, further comprising:

contacting each of said plurality of containers, under conditions and for a time sufficient to promote a multiplex PCR amplification of said first and second reverse-transcribed adaptive immune receptor cDNA amplicons with a second (B) and third (C) oligonucleotide primer sets,

wherein (B) said second oligonucleotide primer set comprises forward and reverse primers capable of amplifying said plurality of first reverse-transcribed adaptor immune receptor cDNA amplicons, wherein said forward and reverse primers each are capable of hybridizing to said first reverse-transcribed adaptive immune receptor cDNA amplicons;

wherein each pair of forward and reverse primers in said second oligonucleotide primer set is capable of amplifying said first reverse-transcribed adaptive immune receptor cDNA amplicons,

wherein said forward primers in said second oligonucleotide primer set comprise a first universal adaptor sequence and a region complementary to said V region encoding gene sequence,

wherein said reverse primers in said second oligonucleotide primer set comprise a second universal adaptor sequence and a region complementary to said J region encoding gene sequence or said C region encoding gene sequence,

wherein (C) said third oligonucleotide primer set comprises forward and reverse primers capable of amplifying said plurality of reverse-transcribed second adaptive immune receptor cDNA amplicons;

wherein each pair of forward and reverse primers in said third oligonucleotide primer set is capable of amplifying said second reverse-transcribed adaptive immune receptor cDNA amplicons,

wherein said forward primers in said third oligonucleotide primer set comprise a first universal adaptor sequence and a region complementary to said V region encoding gene sequence,

wherein said reverse primers in said third oligonucleotide primer set comprise a second universal adaptor sequence and a region complementary to said J region encoding gene sequence or complementary to said C region encoding gene sequence; and

generating i) a plurality of third adaptive immune receptor amplicons each comprising a unique V region encoding gene sequence, or complement thereof, a unique J region encoding gene sequence or both a unique J region encoding gene sequence and a unique C region encoding gene sequence, or complement thereof, and said first and second universal adaptor sequences, and ii) a plurality of fourth adaptive immune receptor amplicons each comprising a unique V region encoding gene sequence, or complement thereof, a unique J region encoding gene sequence or both a unique J region encoding gene sequence and a unique C region encoding gene sequence, or complement thereof, and said first and second universal adaptor sequences.

11. The method of claim 10, further comprising:

contacting each of said plurality of containers, under conditions and for a time sufficient to promote a second multiplex PCR amplification of said plurality of third and fourth adaptive immune receptor amplicons with a fourth (D) oligonucleotide primer set and fifth (E) oligonucleotide primer set,

wherein (D) said fourth oligonucleotide primer set comprises forward and reverse primers capable of amplifying said plurality of third adaptor immune receptor amplicons, wherein said forward and reverse primers each are capable of hybridizing to said third adaptive immune receptor amplicons;

wherein each pair of forward and reverse primers in said fourth oligonucleotide primer set is capable of amplifying said third adaptor immune receptor amplicons,

wherein said forward primer in said fourth oligonucleotide primer set comprises a sequencing platform tag sequence and a region complementary to said first universal adaptor sequence in said plurality of third adaptive immune receptor amplicon and said reverse primer comprises a sequencing platform tag sequence and a region complementary to said second universal adaptor sequence in said plurality of third adaptive immune receptor amplicons,

wherein either one or both of said forward and reverse primers in said fourth oligonucleotide primer set comprises a unique barcode sequence associated with said container in which said fourth oligonucleotide primer set is introduced,

wherein (E) said fifth oligonucleotide primer set comprises forward and reverse primers capable of amplifying said plurality of fourth adaptor immune receptor amplicons, wherein said forward and reverse primers each are capable of hybridizing to said fourth adaptive immune receptor amplicons,

wherein each pair of forward and reverse primers in said fourth oligonucleotide primer set is capable of amplifying said plurality of fourth adaptor immune receptor amplicons,

wherein said forward primer in said fifth oligonucleotide primer set comprises a sequencing platform tag sequence and a region complementary to said first universal adaptor sequence in said plurality of fourth adaptive immune receptor amplicons, and said reverse primer in said fifth oligonucleotide primer set

comprises a sequencing platform tag sequence and a region complementary to said second universal adaptor sequence in said plurality of fourth adaptive immune receptor amplicons,

wherein either one or both of said forward and reverse primers of said fourth oligonucleotide primer set comprises a unique barcode sequence associated with said container in which said fourth oligonucleotide primer set is introduced,

thereby generating said library of amplicons comprising said plurality of first adaptive immune receptor amplicons and said plurality of second adaptive immune receptor amplicons.

12. The method of claim 11, further comprising combining said library of amplicons from said plurality of containers into a mixture for sequencing.

13. The method of claim 1, wherein said plurality of first adaptive immune receptor amplicons comprise a C region encoding sequence.

14. The method of claim 1, wherein said plurality of second adaptive immune receptor amplicons comprise a C region encoding sequence.

15. The method of claim 1, wherein said sample comprises a blood sample.

16. The method of claim 1, wherein said sample comprises a tissue sample.

17. The method of claim 1, wherein said sample comprises a sample purified or cultured human lymphoid cells.

18. The method of claim 1, wherein each container comprises at least 10^4 lymphoid cells.

19. The method of claim 1, wherein said sample comprises at least 10^4 cells.

20. The method of claim 1, wherein said first polypeptide of said adaptive immune receptor heterodimer is a TCR alpha (TCRA) chain and the second polypeptide of said adaptive immune receptor heterodimer is a TCR beta (TCRB) chain.

21. The method of claim 1, wherein said first polypeptide of the adaptive immune receptor heterodimer is a TCR gamma (TCRG) chain and said second polypeptide of said adaptive immune receptor heterodimer is a TCR delta (TCRD) chain.

22. The method of claim 1, wherein said first polypeptide of said adaptive immune receptor heterodimer is an immunoglobulin heavy (IGH) chain and said second polypeptide of the adaptive immune receptor heterodimer is selected from an immunoglobulin light IGL or an IGK chain.

23. The method of claim 22, wherein if the first polypeptide of the adaptive immune receptor heterodimer is an IGH chain and the second polypeptide of the adaptive immune receptor heterodimer is both IGL and IGK, then three different amplification primer sets are used comprising: a first oligonucleotide amplification primer set for IGH, a second oligonucleotide amplification primer set for IGK, and a third oligonucleotide amplification primer set for IGL.

24. A method of identifying a plurality of cognate pairs comprising a first polypeptide and a second polypeptide that form an adaptive immune receptor heterodimer, said adaptive immune receptor heterodimer comprising a T cell receptor (TCR) or Immunoglobulin (IG) from a single clone in a sample, said sample comprising a plurality of lymphoid cells from a mammalian subject, said method comprising:

distributing a plurality of lymphoid cells among a plurality of containers, each container comprising a plurality of lymphoid cells;

generating a library of amplicons in said plurality of containers by performing multiplex PCR of genomic molecules obtained from said plurality of lymphoid cells, said library of amplicons comprising:

i) a plurality of first adaptive immune receptor amplicons encoding said first polypeptide, each comprising a unique variable (V) region encoding sequence, a unique J region encoding sequence, at least one barcode sequence, at least one universal adaptor sequence, and a sequencing platform tag sequence, and

ii) a plurality of second adaptive immune receptor amplicons encoding said second polypeptide, each comprising a unique V region encoding sequence, a unique J region encoding, at least one barcode sequence, at least one universal adaptor sequence, and a sequencing platform tag sequence;

performing high throughput sequencing of said library of amplicons to obtain a data set of a plurality of first and second adaptive immune receptor amplicon sequences;

determining a container occupancy pattern for each unique first adaptor immune receptor amplicon sequence by assigning each unique first adaptor immune receptor amplicon sequence to one or more containers, and a container occupancy pattern for each unique second adaptor immune receptor amplicon

sequence by assigning each unique second adaptor immune receptor amplicon sequence to one or more containers, wherein each barcode sequence in said unique first or second adaptor immune receptor amplicon sequences is associated with a particular container;

for each possible pairing of a unique first and second adaptive immune receptor amplicon sequence to form a putative cognate pair, calculating a statistical probability of observing said container occupancy patterns, or observing any larger proportion of shared containers than expected by chance, given that said first and second adaptor immune receptor amplicon sequences do not originate from the same clonal population of lymphoid cells;

identifying a plurality of a putative cognate pairs based on said statistical probability having a score lower than a predetermined likelihood cutoff;

for each identified putative cognate pair, determining a false discovery rate estimation for a possible false pairing of said unique first adaptor immune receptor amplicon sequence and said unique second adaptor immune receptor amplicon sequence; and

identifying a plurality of cognate pairs of unique first and second adaptive immune receptor sequences as true cognate pairs that encode said adaptive immune receptors in said sample based on said statistical probability and said false discovery rate estimation.

25. The method of claim 24, wherein said statistical score comprises a p-value calculated for pairing each putative cognate pair of unique first and second adaptive immune receptor amplicon sequences.

26. The method of claim 25, wherein calculating said statistical score comprises calculating a probability that said unique first and second adaptive immune receptor amplicon sequences should jointly occupy as many or more containers than they are observed to jointly occupy, assuming no true cognate pairing and given the number of containers occupied by said unique first adaptive immune receptor amplicon sequence and the number of containers occupied by said unique second adaptive immune receptor amplicon sequence.

27. The method of claim 25, wherein identifying a plurality of a putative cognate pairs that have a high likelihood of pairing based on said statistical probability comprises for each unique first adaptor immune receptor amplicon sequence identifying the unique second

adaptor immune receptor amplicon sequence that has the lowest p-value score of matching, or for each unique second adaptor immune receptor amplicon sequence finding the unique first adaptor immune receptor amplicon sequence that has the lowest p-value score of matching.

28. The method of any one of claims 24-27, wherein determining a false discovery rate estimation comprises:

calculating p-values for each of said plurality of putative cognate pairs identified in said sample;

comparing the p-values for all of said plurality of putative cognate pairs with an expected p-value distribution, said expected p-value distribution calculated to represent an experiment where no true cognate pairs are present; and

determining for each putative cognate pair, an expected proportion of false positive results such that all p-values at or below the p-value of said putative cognate pair are determined to represent a true cognate pairing.

29. The method of claim 28, wherein calculating said expected p-value distribution comprises:

permuting the containers in which each first and second adaptive immune receptor sequence has been observed in an otherwise-identical experiment with no true cognate pairs, and

calculating the distribution of p-values associated with each putative cognate pair.

30. The method of claim 29, further comprising identifying a plurality of cognate pairs of unique first and second adaptive immune receptor sequences as true cognate pairs by selecting a plurality of putative cognate pairs that have p-values below a threshold calculated based on said false discovery rate estimation.

31. The method of claim 30, wherein an identified cognate pair of unique first and second adaptive immune receptor amplicon sequences have a false discovery rate estimation of less than 1%.

32. The method of claim 24, further comprising:

contacting each of said plurality of containers, under conditions and for a time sufficient to promote a multiplex PCR amplification of said first and second adaptive immune receptor cDNA amplicons with a first (A) and second (B) oligonucleotide primer sets,

wherein (A) said first oligonucleotide primer set comprises forward and reverse primers capable of amplifying said plurality of first adaptor immune receptor amplicons, wherein said forward and reverse primers each are capable of hybridizing to said first adaptive immune receptor amplicons;

wherein each pair of forward and reverse primers in said first oligonucleotide primer set is capable of amplifying said first adaptive immune receptor amplicons,

wherein said forward primers in said first oligonucleotide primer set comprise a first universal adaptor sequence and a region complementary to said V region encoding gene sequence,

wherein said reverse primers in said second oligonucleotide primer set comprise a second universal adaptor sequence and a region complementary to said J region encoding gene sequence,

wherein (B) said second oligonucleotide primer set comprises forward and reverse primers capable of amplifying said plurality of second adaptive immune receptor amplicons;

wherein each pair of forward and reverse primers in said second oligonucleotide primer set is capable of amplifying said second adaptive immune receptor amplicons,

wherein said forward primers in said second oligonucleotide primer set comprise a first universal adaptor sequence and a region complementary to said V region encoding gene sequence,

wherein said reverse primers in said second oligonucleotide primer set comprise a second universal adaptor sequence and a region complementary to said J region encoding gene sequence; and

generating i) a plurality of third adaptive immune receptor amplicons each comprising a unique V region encoding gene sequence, or complement thereof, a unique J region encoding gene sequence, or complement thereof, and said first and second universal adaptor sequences, and ii) a plurality of fourth adaptive immune receptor amplicons each comprising a unique V region encoding gene sequence, or complement thereof, a unique J region encoding gene sequence, or complement thereof, and said first and second universal adaptor sequences.

33. The method of claim 32, further comprising:

contacting each of said plurality of containers, under conditions and for a time sufficient to promote a second multiplex PCR amplification of said plurality of third and fourth adaptive immune receptor amplicons with a third (C) oligonucleotide primer set and fourth (D) oligonucleotide primer set,

wherein (C) said third oligonucleotide primer set comprises forward and reverse primers capable of amplifying said plurality of third adaptor immune receptor amplicons, wherein said forward and reverse primers each are capable of hybridizing to said third adaptive immune receptor amplicons;

wherein each pair of forward and reverse primers in said third oligonucleotide primer set is capable of amplifying said second adaptor immune receptor amplicons,

wherein said forward primer in said third oligonucleotide primer set comprises a sequencing platform tag sequence and a region complementary to said first universal adaptor sequence in said plurality of third adaptive immune receptor amplicon and said reverse primer in said third oligonucleotide primer set comprises a sequencing platform tag sequence and a region complementary to said second universal adaptor sequence in said plurality of second adaptive immune receptor amplicons,

wherein either one or both of said forward and reverse primers in said fourth oligonucleotide primer set comprises a unique barcode sequence associated with said container in which said third oligonucleotide primer set is introduced,

wherein (D) said fourth oligonucleotide primer set comprises forward and reverse primers capable of amplifying said plurality of fourth adaptor immune receptor amplicons, wherein said forward and reverse primers each are capable of hybridizing to said fourth adaptive immune receptor amplicons,

wherein each pair of forward and reverse primers in said fourth oligonucleotide primer set is capable of amplifying said plurality of fourth adaptor immune receptor amplicons,

wherein said forward primer in said fourth oligonucleotide primer set comprises a sequencing platform tag sequence and a region complementary to said first universal adaptor sequence in said plurality of fourth adaptive immune receptor amplicons, and said reverse primer in said fourth oligonucleotide primer set comprises a sequencing platform tag sequence and a region complementary to said second universal adaptor sequence in said plurality of fourth adaptive immune receptor amplicons,

wherein either one or both of said forward and reverse primers of said fourth oligonucleotide primer set comprises a unique barcode sequence associated with said container in which said fourth oligonucleotide primer set is introduced,

thereby generating said library of amplicons comprising said plurality of first adaptive immune receptor amplicons and said plurality of second adaptive immune receptor amplicons.

34. The method of claim 33, further comprising combining said library of amplicons from said plurality of containers into a mixture for sequencing.

35. The method of claim 24, wherein said sample comprises a blood sample.

36. The method of claim 24, wherein said sample comprises a tissue sample.

37. The method of claim 24, wherein said sample comprises a sample purified or cultured human lymphoid cells.

38. The method of claim 24, wherein each container comprises at least 10^4 lymphoid cells.

39. The method of claim 241, wherein said sample comprises at least 10^4 cells.

40. The method of claim 24, wherein said first polypeptide of said adaptive immune receptor heterodimer is a TCR alpha (TCRA) chain and the second polypeptide of said adaptive immune receptor heterodimer is a TCR beta (TCRB) chain.

41. The method of claim 24, wherein said first polypeptide of the adaptive immune receptor heterodimer is a TCR gamma (TCRG) chain and said second polypeptide of said adaptive immune receptor heterodimer is a TCR delta (TCRD) chain.

42. The method of claim 24, wherein said first polypeptide of said adaptive immune receptor heterodimer is an immunoglobulin heavy (IGH) chain and said second polypeptide of the adaptive immune receptor heterodimer is selected from an immunoglobulin light IGL or an IGK chain.

43. The method of claim 42, wherein if the first polypeptide of the adaptive immune receptor heterodimer is an IGH chain and the second polypeptide of the adaptive immune receptor heterodimer is both IGL and IGK, then three different amplification primer sets are used comprising: a first oligonucleotide amplification primer set for IGH, a second oligonucleotide amplification primer set for IGK, and a third oligonucleotide amplification primer set for IGL.
