

RECLINING CHAIR PROVIDED WITH MEANS TO NEGOTIATE A WALL CONTIGUOUS TO SAME

ABSTRACT OF THE DISCLOSURE

A reclining chair comprises a base frame, a support frame, a backrest frame, a driving device, and two driven guide rods. The base frame is in contact with the floor. The support frame is slidably mounted on the base frame such that the support frame is driven by the driving device to slide back and forth on the base frame. When the support frame is driven to slide forward, the backrest frame is pulled by the two driven guide rods to recline. When the support frame is driven to slide backward, the backrest frame is pushed by the two driven guide rods to return to its upright position.
