

ABSTRACT

Disclosed are a physical channel monitoring method and a terminal device. The method comprises: a terminal device being configured with at least one serving cell group; and the terminal device performing PDCCH monitoring on a first serving cell according to a first serving cell group, wherein the first serving cell is a serving cell included in the first serving cell group, and the first serving cell group is a serving cell group in the at least one serving cell group. By using the embodiments of the present application, a search space group switching behaviour when a terminal device performs PDCCH monitoring on a plurality of cells in a serving cells in a serving cell group according to a search space group can be determined.
