

ABSTRACT

The present disclosure provides a method, device and apparatus for determining a channel detection mechanism as well as a storage medium, relating to the technical field of communications. The method comprises: a terminal receives a notification message sent by a base station; and the terminal determines the channel detection mechanism used for uplink transmission according to the notification message. According to the present disclosure, the terminal is enabled to accurately determine the channel detection mechanism used for uplink transmission, thereby achieving fair and efficient occupation of channel resources with other wireless communication systems on unlicensed spectrum.
