10

BACKGROUND OF THE INVENTION

Bone morphogenetic protein (BMP) signaling belongs to the transforming growth factor beta (TGF- β) superfamily and TGF- β signaling ligands include more than 25 different ligands: TGF- β growth and differentiation factors, BMPs and Activins. The binding of BMP ligands leads to the assembly of tetrameric receptor complexes composed of two constitutively-active type II receptor serine/threonine kinases (BMPRII, ACTRIIA, or ACTRIIB) and activate two type I receptor serine/threonine kinases (ALK1, ALK2, ALK3, or ALK6). Furthermore, the activated type I receptors phosphorylate BMP receptor responsive SMAD proteins 1/5/8 and the activated SMAD1/5/8 associated with co-SMAD4 translocate to the nucleus to regulate gene transcription. (Ross, S.L., et al. Cell Metabolism 2012, 15, 905-917; Blobe, G.C., et al. New England Journal of Medicine 2000, 342, 1350-1358).

BMPR kinase activin A receptor, type I (ACVR1) is also called activin receptor-like kinase-2 (ALK2). It is composed of a ligand-binding extracellular domain and a cytoplasmic domain with serine/threonine specificity. ALK2 has been reported to mediate multiple human diseases (Massague, J., et al. Cell 2000, 103, 295-309; Taylor, K.R., et al. Cancer Research 2014, 74, 4565-4570). ALK2 and ALK3 have been shown to play an essential role in regulating the hepcidin levels and affecting the anemia of chronic disease (Andriopoulos, B., et al. Nature Genetics 2009 41, 482-487; Steinbicker, A.U., et al. Blood 2011, 118, 4224-4230; Steinbicker, A.U., et al. Blood 2011, 117, 4915-4923). Hepcidin is a small peptide hormone primarily synthesized in hepatocytes and reduces both duodenal iron absorption and iron export from monocytes/macrophages by binding to and inducing the internalization and degradation of the iron exporter ferroportin (FPN1) (Theurl, I. et al. Haematologica 2011, 96, 1761-1769; Zhao, N., et al. Journal of Clinical Investigation 2013, 123, 2337-2343). The elevated serum hepcidin levels enhance storage of iron within the reticuloendothelial system

and result in reduced iron availability and iron restricted erythropoiesis. Inappropriately increased hepcidin expression causes severe functional iron deficiency anemia in humans and is central to the pathophysiology of anemia of chronic disease (ACD) (Weiss, G. et al. New England Journal of Medicine 2005, 352, 1011-1023). Accordingly, there is a need for new
5 compounds that modulate ALK2 activity.

It is further appreciated that certain features of the present disclosure, which are, for clarity, described in the context of separate embodiments, can also be provided in combination in a single embodiment (while the embodiments are intended to be combined as if written in multiply dependent form). Conversely, various features of the present disclosure, which are, for brevity, described in the context of a single embodiment, can also be provided
20 separately or in any suitable subcombination. Thus, it is contemplated as features described as embodiments of the compounds of Formula (I) can be combined in any suitable combination.
25

At various places in the present specification, certain features of the compounds are disclosed in groups or in ranges. It is specifically intended that such a disclosure include each
30 and every individual subcombination of the members of such groups and ranges. For example, the term "C₁₋₆ alkyl" is specifically intended to individually disclose (without limitation) methyl, ethyl, C₃ alkyl, C₄ alkyl, C₅ alkyl and C₆ alkyl.

The term "n-membered," where n is an integer, typically describes the number of ring-forming atoms in a moiety where the number of ring-forming atoms is n. For example,

piperidinyl is an example of a 6-membered heterocycloalkyl ring, pyrazolyl is an example of a 5-membered heteroaryl ring, pyridyl is an example of a 6-membered heteroaryl ring and 1,2,3,4-tetrahydro-naphthalene is an example of a 10-membered cycloalkyl group.

At various places in the present specification, variables defining divalent linking groups may be described. It is specifically intended that each linking substituent include both the forward and backward forms of the linking substituent. For example, -NR(CR'R")_n- includes both -NR(CR'R")_n- and -(CR'R")_nNR- and is intended to disclose each of the forms individually. Where the structure requires a linking group, the Markush variables listed for that group are understood to be linking groups. For example, if the structure requires a linking group and the Markush group definition for that variable lists "alkyl" or "aryl" then it is understood that the "alkyl" or "aryl" represents a linking alkylene group or arylene group, respectively.

The term "substituted" means that an atom or group of atoms formally replaces hydrogen as a "substituent" attached to another group. The term "substituted", unless otherwise indicated, refers to any level of substitution, *e.g.*, mono-, di-, tri-, tetra- or penta-substitution, where such substitution is permitted. The substituents are independently selected, and substitution may be at any chemically accessible position. It is to be understood that substitution at a given atom is limited by valency. It is to be understood that substitution at a given atom results in a chemically stable molecule. The phrase "optionally substituted" means unsubstituted or substituted. The term "substituted" means that a hydrogen atom is removed and replaced by a substituent. A single divalent substituent, *e.g.*, oxo, can replace two hydrogen atoms.

A series of imidazo[1,2-b]pyridazine derivatives **7** can be prepared according to the procedure outlined in Scheme 1. Aminopyridazine **3** can be obtained by palladium catalytic amination (*Tetrahedron Lett.* **1997**, 38, 6367-6370) of the dichloropyridazine **1** with diphenylmethanimine followed by hydrolysis under acidic conditions. Cycloaddition of the aminopyridazine **3** with 2-chloroacetaldehyde gives the imidazo[1,2-b]pyridazine **4** which can be converted to the corresponding imidazo[1,2-b]pyridazine iodide **5** by treatment with NIS. Suzuki coupling (*J. Am. Chem. Soc.* **2010**, 132, 14073-14075) with the boronic acid or ester $\text{R}^5\text{B}(\text{OR}')_2$ affords compound **6** which can be converted to the desired imidazo[1,2-b]pyridazine derivatives **7** by further Suzuki coupling with a suitable boronic acid or ester $\text{R}^2\text{B}(\text{OR}')_2$. Alternatively, Suzuki coupling of imidazo[1,2-b]pyridazine **4** with the boronic acid or ester $\text{R}^2\text{B}(\text{OR}')_2$ affords compound **8** which can be converted to compound **9** by treatment with NIS. The imidazo[1,2-b]pyridazine iodide **9** can be subsequently converted to

the desired imidazo[1,2-b]pyridazine derivatives **7** by Suzuki coupling with a suitable boronic acid or ester $R^5B(OR')_2$.

Scheme 1

A series of imidazo[1,2-b]pyridazine-6-carboxamide derivatives **12** can be prepared according to the procedure outlined in Scheme 2. Methyl imidazo[1,2-b]pyridazine-6-carboxylate **10** prepared according to the procedure outlined in Scheme 1 can be converted to the corresponding acid **11** by hydrolysis. The acid **11** can be subsequently converted to the desired imidazo[1,2-b]pyridazine-6-carboxamide derivatives **12** by coupling with an appropriate amine using an amidation coupling reagent such as, but not limited to, (benzotriazol-1-yloxy)tris(dimethylamino)phosphonium hexafluorophosphate (BOP), (benzotriazol-1-yloxy)tripyrrolidinophosphonium hexafluorophosphate (PyBOP), 1-[bis(dimethylamino)methylene]-1H-1,2,3-triazolo[4,5-b]pyridinium 3-oxid hexafluorophosphate (HATU), or N,N,N',N'-Tetramethyl-O-(1H-benzotriazol-1-yl)uronium hexafluorophosphate (HBTU).

Methyl imidazo[1,2-b]pyridazine-6-carboxylate **13**, prepared according to the procedure outlined in Scheme 1, can be converted to the corresponding acid **14** by hydrolysis. The acid **14** can be subsequently converted to imidazo[1,2-b]pyridazine-6-carboxamide **15** by coupling with ammonium chloride using an amidation coupling reagent such as HATU. Treating compound **15** with oxalyl chloride in the presence of triethylamine and triphenylphosphine oxide can afford compound **16** which then can be converted to the corresponding iodide **17** by treatment with NIS. Suzuki coupling with a suitable boronic acid or ester $\text{R}^5\text{B}(\text{OR}')_2$ affords the desired imidazo[1,2-b]pyridazine-6-carbonitrile derivatives **18**.

Scheme 3

A series of imidazo[1,2-b]pyridazine derivatives **23** can be prepared according to the procedure outlined in Scheme 4. Methyl 7-chloroimidazo[1,2-b]pyridazine-6-carboxylate **19** prepared according to the procedure outlined in Scheme 1 can be converted to the corresponding alcohol **20** by reduction. The alcohol **20** can be subsequently converted to compound **21** via Suzuki coupling with the boronic acid or ester $\text{R}^2\text{B}(\text{OR}')_2$. Treating compound **21** with NIS affords the corresponding iodide **22** which can be converted to the

desired imidazo[1,2-b]pyridazine derivatives **23** through Suzuki coupling with a suitable boronic acid or ester $R^5B(OR')_2$.

Scheme 4

Cycloaddition of the aminopyridine **24** with 2-chloroacetaldehyde gives compound **25** which can be converted to compound **26** via Suzuki coupling with the boronic acid or ester $R^2B(OR')_2$. Treating compound **26** with NIS affords the corresponding iodide **27** which can be converted to the desired imidazo[1,2-a]pyridine derivatives **28** through Suzuki coupling with a suitable boronic acid or ester $R^5B(OR')_2$.

15 The invention will be described in greater detail by way of specific examples. The following examples are offered for illustrative purposes, and are not intended to limit the invention in any manner. Those of skill in the art will readily recognize a variety of non-

critical parameters which can be changed or modified to yield essentially the same results.
The compounds of the Examples were described as below.

Preparatory LC-MS purifications of some of the compounds prepared were performed on Waters mass directed fractionation systems. The basic equipment setup, protocols, and control software for the operation of these systems have been described in detail in the literature. See e.g. "Two-Pump At Column Dilution Configuration for Preparative LC-MS", K. Blom, *J. Combi. Chem.*, 4, 295 (2002); "Optimizing Preparative LC-MS Configurations and Methods for Parallel Synthesis Purification", K. Blom, R. Sparks, J. Doughty, G. Everlof, T. Haque, A. Combs, *J. Combi. Chem.*, 5, 670 (2003); and "Preparative LC-MS Purification: Improved Compound Specific Method Optimization", K. Blom, B. Glass, R. Sparks, A. Combs, *J. Combi. Chem.*, 6, 874-883 (2004). Blom, B. Glass, R. Sparks, A. Combs, *J. Comb. Chem.*, 6, 874-883 (2004)].

Methods of Use

The present disclosure provides methods of modulating (e.g., inhibiting) ALK2 activity, said method comprising administering to a patient a compound provided herein, or a pharmaceutically acceptable salt thereof. The compounds of the present disclosure can be used alone, in combination with other agents or therapies or as an adjuvant or neoadjuvant for the treatment of diseases or disorders, including cancers. For the uses described herein, any of the compounds of the disclosure, including any of the embodiments thereof, may be used.

In myelofibrosis (MF), a significant proportion of patients develop anemia and become dependent on frequent red blood cell (RBC) transfusions (Tefferi, A. et al. Mayo Clinic Proceedings 2012 87, 25-33). Elevated serum hepcidin levels in patients with MF have been shown to be associated with hemoglobin (Hb) levels, increased requirement for RBC transfusions and reduced survival (Pardanani, A. et al. American Journal of Hematology 2013, 88, 312-316). BMP signaling plays a central role in driving hepcidin transcriptional induction by activating SMAD signaling. In anemia mouse model, the liver-specific deletion of either ALK2 or ALK3 can block the induction of hepcidin production and iron overload (Steinbicker, A.U., et al. Blood 2011, 118, 4224-4230). Therefore, ALK2 inhibition could be useful in combination with ruxolitinib in the treatment of MF patients as the hepcidin-mediated FPN1 internalization and degradation may not require the action of JAK2 (Ross, S.L., et al. Cell Metabolism 2012, 15, 905-917). The ALK2 inhibition may block the negative effect of hepcidin on iron metabolism and improve the anemia in MF patients (Asshoff, M. et al. Blood 2017, 129, 1823-1830).

Fibrodysplasia ossificans progressiva (FOP) is a human rare genetic bone disease and the patients were characterized by extraskeletal bone formation through endochondral ossification (Yu, P.B., et al. Nature Medicine 2008, 14, 1363-1369; Fukuda, T. et al. Journal of Biological Chemistry 2009 284, 7149-7156). 95% of FOP patients harbor point mutations in ACVR1/ALK2 and The responsive mutation for classic FOP is 617G>A (R206H) in the intracellular glycine and serine-rich (GS) domain of ALK2 (Shen, Q. et al. Journal of Clinical Investigation 2009, 119, 3462-3472). ALK2 mutations in atypical FOP patients have also been found in other amino acids of the GS domain or protein kinase domain (Fukuda, T. et al. Biochemical and Biophysical Research Communications 2008, 377, 905-909). The different ALK2 mutants have been shown to activate BMP signaling without exogenous BMP ligands constitutively and these ALK2 mutants can transmit much stronger BMP signaling upon

ligand stimulation (Van Dinther, M. et al. Journal of Bone and Mineral Research 2010, 25, 1208-1215).

Activating mutations in ALK2 have also been identified in diffuse intrapontine gliomas (DIPG), which are highly aggressive glial neoplasms of the ventral pons in the pediatric population. ALK2 was reported as one of the most recurrently mutated gene in DIPG. ALK2 was found to carry nonsynonymous heterozygous somatic mutations in 46 of 195 (24%) cases at five specific residues. Patients with ALK2 mutations were predominantly female (approximately 2:1) and had a younger age of onset (approximately 5 years) and longer overall survival time (approximately 15 months) compared with wild-type IDPG. These ALK2 mutants are highly specific to DIPG and the ALK2 inhibitor LDN-19318917 results in significant inhibition of those ALK2 mutant DIPG cell viability (Taylor, K.R. et al. Nature Genetics 2014, 46, 457-461; Buczkowicz, P. et al. Nature Genetics 2014, 46, 451-456).

25 "unit dosage forms" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient.

 The components used to formulate the pharmaceutical compositions are of high purity and are substantially free of potentially harmful contaminants (*e.g.*, at least National
30 Food grade, generally at least analytical grade, and more typically at least pharmaceutical grade). Particularly for human consumption, the composition is preferably manufactured or formulated under Good Manufacturing Practice standards as defined in the applicable regulations of the U.S. Food and Drug Administration. For example, suitable formulations

The active compound may be effective over a wide dosage range and is generally administered in a therapeutically effective amount. It will be understood, however, that the amount of the compound actually administered will usually be determined by a physician, according to the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered, the age, weight, and response of the individual patient, the severity of the patient's symptoms and the like.

The therapeutic dosage of a compound of the present invention can vary according to, *e.g.*, the particular use for which the treatment is made, the manner of administration of the compound, the health and condition of the patient, and the judgment of the prescribing physician. The proportion or concentration of a compound of the present disclosure in a pharmaceutical composition can vary depending upon a number of factors including dosage, chemical characteristics (*e.g.*, hydrophobicity), and the route of administration. For example, the compounds of the present disclosure can be provided in an aqueous physiological buffer solution containing about 0.1 to about 10% w/v of the compound for parenteral administration. Some typical dose ranges are from about 1 µg/kg to about 1 g/kg of body weight per day. In some embodiments, the dose range is from about 0.01 mg/kg to about 100 mg/kg of body weight per day. The dosage is likely to depend on such variables as the type and extent of progression of the disease or disorder, the overall health status of the particular patient, the relative biological efficacy of the compound selected, formulation of the excipient, and its route of administration. Effective doses can be extrapolated from dose-response curves derived from in vitro or animal model test systems.

For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical excipient to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention. When referring to these preformulation compositions as homogeneous, the active ingredient is typically dispersed evenly throughout the composition so that the composition can be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation is then subdivided into unit dosage forms of the type described above containing from, *e.g.*, about 0.1 to about 1000 mg of the active ingredient of the present invention.

The tablets or pills of the present invention can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the

tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permit the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the compounds and compositions of the present invention can be incorporated for administration orally or by injection include aqueous solutions, suitably flavored syrups, aqueous or oil suspensions, and flavored emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil, or peanut oil, as well as elixirs and similar pharmaceutical vehicles.

Compositions for inhalation or insufflation include solutions and suspensions in pharmaceutically acceptable, aqueous or organic solvents, or mixtures thereof, and powders. The liquid or solid compositions may contain suitable pharmaceutically acceptable excipients as described *supra*. In some embodiments, the compositions are administered by the oral or nasal respiratory route for local or systemic effect. Compositions can be nebulized by use of inert gases. Nebulized solutions may be breathed directly from the nebulizing device or the nebulizing device can be attached to a face mask, tent, or intermittent positive pressure breathing machine. Solution, suspension, or powder compositions can be administered orally or nasally from devices which deliver the formulation in an appropriate manner.

Topical formulations can contain one or more conventional carriers. In some embodiments, ointments can contain water and one or more hydrophobic carriers selected from, *e.g.*, liquid paraffin, polyoxyethylene alkyl ether, propylene glycol, white Vaseline, and the like. Carrier compositions of creams can be based on water in combination with glycerol and one or more other components, *e.g.*, glycerinemonostearate, PEG-glycerinemonostearate and cetylstearyl alcohol. Gels can be formulated using isopropyl alcohol and water, suitably in combination with other components such as, *e.g.*, glycerol, hydroxyethyl cellulose, and the like. In some embodiments, topical formulations contain at least about 0.1, at least about 0.25, at least about 0.5, at least about 1, at least about 2 or at least about 5 wt % of the compound of the present disclosure. The topical formulations can be suitably packaged in tubes of, *e.g.*, 100 g which are optionally associated with instructions for the treatment of the select indication, *e.g.*, psoriasis or other skin condition.

The amount of compound or composition administered to a patient will vary depending upon what is being administered, the purpose of the administration, such as prophylaxis or therapy, the state of the patient, the manner of administration and the like. In therapeutic applications, compositions can be administered to a patient already suffering
5 from a disease in an amount sufficient to cure or at least partially arrest the symptoms of the disease and its complications. Effective doses will depend on the disease condition being treated as well as by the judgment of the attending clinician depending upon factors such as the severity of the disease, the age, weight and general condition of the patient and the like.

The compositions administered to a patient can be in the form of pharmaceutical
10 compositions described above. These compositions can be sterilized by conventional sterilization techniques, or may be sterile filtered. Aqueous solutions can be packaged for use as is, or lyophilized, the lyophilized preparation being combined with a sterile aqueous carrier prior to administration. The pH of the compound preparations typically will be between 3 and 11, more preferably from 5 to 9 and most preferably from 7 to 8. It will be
15 understood that use of certain of the foregoing excipients, carriers or stabilizers will result in the formation of pharmaceutical salts.

The therapeutic dosage of a compound of the present invention can vary according to, *e.g.*, the particular use for which the treatment is made, the manner of administration of the compound, the health and condition of the patient, and the judgment of the prescribing
20 physician. The proportion or concentration of a compound of the present disclosure in a pharmaceutical composition can vary depending upon a number of factors including dosage, chemical characteristics (*e.g.*, hydrophobicity), and the route of administration. For example, the compounds of the present disclosure can be provided in an aqueous physiological buffer solution containing about 0.1 to about 10% w/v of the compound for parenteral
25 administration. Some typical dose ranges are from about 1 µg/kg to about 1 g/kg of body weight per day. In some embodiments, the dose range is from about 0.01 mg/kg to about 100 mg/kg of body weight per day. The dosage is likely to depend on such variables as the type and extent of progression of the disease or disorder, the overall health status of the particular patient, the relative biological efficacy of the compound selected, formulation of
30 the excipient, and its route of administration. Effective doses can be extrapolated from dose-response curves derived from *in vitro* or animal model test systems.

Labeled Compounds and Assay Methods

The compounds of the present disclosure can further be useful in investigations of biological processes in normal and abnormal tissues. Thus, another aspect of the present invention relates to fluorescent dye, spin label, heavy metal or radio-labeled compounds provided herein that would be useful not only in imaging techniques but also in assays, both
5 *in vitro* and *in vivo*, for localizing and quantitating ALK2 protein in tissue samples, including human, and for identifying ALK2 ligands by inhibition binding of a labeled compound. Accordingly, the present invention includes ALK2 binding assays that contain such labeled compounds.

The present invention further includes isotopically-substituted compounds of the
10 disclosure. An "isotopically-substituted" compound is a compound of the present disclosure where one or more atoms are replaced or substituted by an atom having the same atomic number but a different atomic mass or mass number. Compounds of the present disclosure may contain isotopes in a natural abundance as found in nature. Compounds of the present disclosure may also have isotopes in amounts greater to that found in nature, e.g.,
15 synthetically incorporating low natural abundance isotopes into the compounds of the present disclosure so they are enriched in a particularly useful isotope (e.g., ^2H and ^{13}C). It is to be understood that a "radio-labeled" compound is a compound that has incorporated at least one isotope that is radioactive (e.g., radionuclide), e.g., ^3H and ^{14}C . Suitable radionuclides that may be incorporated in compounds of the present invention include but are not limited to ^3H
20 (also written as T for tritium), ^{11}C , ^{13}C , ^{14}C , ^{13}N , ^{15}N , ^{15}O , ^{17}O , ^{18}O , ^{18}F , ^{35}S , ^{36}Cl , ^{82}Br , ^{75}Br , ^{76}Br , ^{77}Br , ^{123}I , ^{124}I , ^{125}I and ^{131}I . The radionuclide that is incorporated in the instant radio-labeled compounds will depend on the specific application of that radio-labeled compound. In some embodiments, the radionuclide is selected from the group consisting of ^3H , ^{14}C , ^{125}I , ^{35}S and ^{82}Br . For *in vitro* ALK2 labeling and competition assays, compounds that
25 incorporate ^3H , ^{14}C , ^{82}Br , ^{125}I , ^{131}I , or ^{35}S will generally be most useful. For radio-imaging applications ^{11}C , ^{18}F , ^{125}I , ^{123}I , ^{124}I , ^{131}I , ^{75}Br , ^{76}Br or ^{77}Br will generally be most useful. The present disclosure can further include synthetic methods for incorporating radio-isotopes into compounds of the disclosure. Synthetic methods for incorporating radio-isotopes into organic compounds are well known in the art and a person of ordinary skill in the art will readily
30 recognize the methods applicable for the compounds of disclosure.

One or more constituent atoms of the compounds presented herein can be replaced or substituted with isotopes of the atoms in natural or non-natural abundance. In some embodiments, the compound includes at least one deuterium atom. In some embodiments, the compound includes two or more deuterium atoms. In some embodiments, the compound

includes 1-2, 1-3, 1-4, 1-5, or 1-6 deuterium atoms. In some embodiments, all of the hydrogen atoms in a compound can be replaced or substituted by deuterium atoms.

Synthetic methods for including isotopes into organic compounds are known in the art (Deuterium Labeling in Organic Chemistry by Alan F. Thomas (New York, N.Y.,
5 Appleton-Century-Crofts, 1971; The Renaissance of H/D Exchange by Jens Atzrodt, Volker Derdau, Thorsten Fey and Jochen Zimmermann, Angew. Chem. Int. Ed. 2007, 7744-7765; The Organic Chemistry of Isotopic Labelling by James R. Hanson, Royal Society of Chemistry, 2011). Isotopically labeled compounds can be used in various studies such as NMR spectroscopy, metabolism experiments, and/or assays.

10 Substitution with heavier isotopes, such as deuterium, may afford certain therapeutic advantages resulting from greater metabolic stability, for example, increased *in vivo* half-life or reduced dosage requirements, and hence may be preferred in some circumstances. (see *e.g.*, A. Kerekes et. al. *J. Med. Chem.* 2011, 54, 201-210; R. Xu et. al. *J. Label Compd. Radiopharm.* 2015, 58, 308-312). In particular, substitution at one or more metabolism sites
15 may afford one or more of the therapeutic advantages. Specifically, a labeled compound of the present disclosure can be used in a screening assay to identify and/or evaluate compounds. For example, a newly synthesized or identified compound (*i.e.*, test compound) which is labeled can be evaluated for its ability to bind a ALK2 protein by monitoring its concentration variation when contacting with the ALK2, through tracking of the labeling. For
20 example, a test compound (labeled) can be evaluated for its ability to reduce binding of another compound which is known to bind to a ALK2 protein (*i.e.*, standard compound). Accordingly, the ability of a test compound to compete with the standard compound for binding to the ALK2 protein directly correlates to its binding affinity. Conversely, in some other screening assays, the standard compound is labeled and test compounds are unlabeled.
25 Accordingly, the concentration of the labeled standard compound is monitored in order to evaluate the competition between the standard compound and the test compound, and the relative binding affinity of the test compound is thus ascertained.

Kits

30 The present disclosure also includes pharmaceutical kits useful, *e.g.*, in the treatment or prevention of diseases or disorders associated with the activity of ALK2, such as cancer or infections, which include one or more containers containing a pharmaceutical composition comprising a therapeutically effective amount of a compound of Formula I, or any of the embodiments thereof. Such kits can further include one or more of various conventional

pharmaceutical kit components, such as, *e.g.*, containers with one or more pharmaceutically acceptable carriers, additional containers, *etc.*, as will be readily apparent to those skilled in the art. Instructions, either as inserts or as labels, indicating quantities of the components to be administered, guidelines for administration, and/or guidelines for mixing the components, can also be included in the kit.

The invention will be described in greater detail by way of specific examples. The following examples are offered for illustrative purposes, and are not intended to limit the invention in any manner. Those of skill in the art will readily recognize a variety of non-critical parameters which can be changed or modified to yield essentially the same results.

The compounds of the Examples have been found to inhibit the activity of ALK2 according to at least one assay described herein.

Example A. ALK2 HTRF Assay

ALK2 (aa 147-end) was obtained from BPS biosciences. The enzymatic assays were conducted in white 384-well polystyrene plates in a final volume of 8 μ L. The inhibitors were serially diluted in DMSO and added to the plate wells prior to addition of the other reaction components. The assays were carried out at 25 °C in the assay buffer (50 mM HEPES, pH 7.0, 10% Glycerol, 0.01% Brij50, 10 mM $MgCl_2$, 1 mM EGTA, 5 mM DTT, and 0.01% BSA), containing 50 nM LANCE Ultra ULight™-DNA Topoisomerase 2-alpha peptide (Perkin Elmer TRF0130), and 3 μ M ATP. The final concentration of DMSO in the assay was 1% and the enzyme concentration was 0.5 nM for ALK2. The reactions were allowed to proceed for 2 hr for ALK2 after which, the reaction was quenched by addition of EDTA at a final concentration of 20 mM along with 1.5 nM LANCE Ultra Europium-anti-phospho-DNA Topoisomerase 2-alpha (Thr1342) antibody (Perkin Elmer TRF0218). The reaction was incubated at 25 °C for 1 hr and read on a PHERAstar FS plate reader (BMG Labtech). IC₅₀ determination was performed by fitting percent control activity versus the log of the inhibitor concentration using the IDBS XLFit and GraphPad Prism 5.0 software.

Compounds of the present disclosure, as exemplified in Examples, showed the IC₅₀ values in the following ranges: + = IC₅₀ ≤ 1 nM; ++ = 1 nM < IC₅₀ ≤ 5 nM; +++ = 5 nM < IC₅₀ ≤ 100 nM, ++++ = IC₅₀ > 100 nM.

Example B. ALK2 cellular assay

HeLa cells are cultured in MEM media with 10% FBS. Recombinant human BMP-7 is obtained from R&D Systems (cat # 354-BP) and phospho SMAD1 (S463/S465) HTRF kit is purchased from Cisbio (63ADK062PEH). HeLa cells are plated in a 96 well flat-bottomed plate at 50,000 cells per well and incubated overnight. The next day, the media is removed and 50 μ l fresh complete media is added. 5 μ l compound is added to cells (3 μ M final concentration at highest) and incubated for 60 min at 37°C. 200ng/ml BMP-7 is added and incubated for 30min at 37°C. After incubation, the media is removed, washed 2x PBS, and processed with an HTRF kit according to Cisbio HTRF kit instructions for measuring the Phospho SMAD1 (S463/S465). Finally, both the donor and acceptor are added into 384 well plates and incubated at room temperature overnight and the HTRF signal is measured via Pherastar next day.
