WEB CAMERA IDENTIFICATION SYSTEM AND METHOD

ABSTRACT

A web camera identification system and method are described. The system uses a web camera, a client computer, and a server website. The web camera stores an authentication password and a video communication application. The server website has an authentication module for identifying the web camera and a function module. After the client computer installs the video communication application provided by the web camera, the web camera can connect to the server website via the client computer. The server website authenticates availability of the web camera by checking the authentication password. The web camera may obtain the services provided by the function module after passing the authentication.
