

ABSTRACT

The present disclosure belongs to the technical field of communications. Provided are methods and apparatuses for recording a PScell addition or change success report, and devices and storage media. A method comprises: a terminal device receiving a configuration message sent by a network-side device, wherein the configuration message comprises a trigger condition configuration therein; and according to the trigger condition configuration, recording a PScell addition or change success report. Thus, in the present disclosure, with regard to the case that “the recording of a PScell addition or change success report is not currently supported”, a processing method is provided, so as to provide an additional acknowledgement opportunity, thereby increasing the PScell addition or change success rate.
