ABSTRACT

A communication method, performed by an access point (AP), includes: determining a first frame in a case that basic service set (BSS) parameters of a BSS where the AP is located change; the first frame identifying that the AP terminates a sensing by proxy (SBP) procedure or terminates a triggered based sounding (TB) sensing measurement procedure, and the first frame including a measurement session identification (ID) of a measurement session terminated; and sending (203) the first frame to an unassociated station (U-STA).
