DATA QUERY METHODS AND APPARATUSES, STORAGE MEDIA, AND ELECTRONIC DEVICES

ABSTRACT

This specification discloses data query methods and apparatuses, storage media, and electronic devices. Based on an execution order of query operations involved in an execution plan generated when a query statement is executed by a database, it can be determined which query operations in the execution plan are subject to deduplication of query results. This can reduce task load in subsequent query operations executed by the database and deduplicate the query results of the determined query operations, thereby improving efficiency of querying data in the database.
