

ABSTRACT

TRANSLATION DEVICE AND TRANSLATION METHOD

A translation device includes an input unit and a controller. The input unit obtains first text data in a first language. The controller generates
5 second text data in a second language that is a translation of the first text data. The controller further generates first replacement data by replacing a first term, of a predetermined type, contained in the first text data by a parameter, obtains second replacement data, in the second language, corresponding to the first replacement data, and generates the second text data by replacing the
10 parameter contained in the second replacement data by a second term in the second language that is a translation of the first term.
