COMMERCIAL TRANSACTION SYSTEM, ADMINISTRATION SERVER, AND PROGRAM

ABSTRACT

A commerce system (10) includes an EC server (200) that connects to a user terminal (500) and executes E-commerce, a customs clearance authentication server (400) that administers pre-customs clearance information, and an administration server (300) that is connected to the customs clearance authentication server and the EC server. The administration server receives a registration request including product information regarding a product from a product administration server, transmits the registration request to the customs clearance authentication server, receives pre-customs clearance information regarding the product from the customs clearance authentication server, and notifies the pre-customs clearance information to the EC server. The customs clearance authentication server generates pre-customs clearance information based on the product information, in response to a request from the EC server, and transmits the generated pre-customs clearance information to the administration server. The EC server transmits the received pre-customs clearance information along with product information to the user terminal, and accepts, from the user terminal, an instruction to circulate the product specified by the product information via customs.
