

ABSTRACT

The present disclosure relates to a paging response method, comprising: when being in a connection state with a first operator network, determining information concerning a first priority for communication with the first operator network; upon receiving a paging message of a second operator network, acquiring, from the paging message, information concerning a second priority for communication between the second operator network and a terminal; according to the information concerning the first priority and the information concerning the second priority, determining to maintain a connection state with the first operator network or to disconnect from the first operator network, and responding to a paging message of the second operator network. Compared with the prior art, the embodiments of the present disclosure enable a terminal to select to maintain a connection state with a first operator network, or disconnect from the first operator network, and respond to a selection result of a paging message of a second operator network, thereby more easily satisfying actual requirements of the first operator network and the second operator network, and further ensuring a communication effect of the terminal.
