

Abstract

A Filtration Base For Vacuum Membrane Filtration

A filtration base (12) for vacuum membrane filtration applications comprises a membrane bearing area (30) on the upper side of the filtration base (12), which
5 has a bearing structure (34) and a supporting contour (32) surrounding the bearing structure (34) for a membrane filter (16) placed in the membrane bearing area (30). The supporting contour (32) has at least one notch (44) which is in flow connection with the bottom side of the membrane bearing area (30) and which is arranged such that it is adapted to be selectively covered by a membrane filter
10 (16) placed in the membrane bearing area (30).
