PAH-MODULATING COMPOSITIONS AND METHODS

SEQUENCE LISTING

The instant application contains a Sequence Listing which has been submitted electronically in XML format compliant with WIPO Standard ST.26 and is hereby incorporated by reference in its entirety. Said XLM copy, created on November 7, 2022, is named V2065-7025WO_SL.xml and is 51,647,776 bytes in size.

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of U.S. Provisional Application No. 63/241,897, filed September 8, 2021, U.S. Provisional Application No. 63/303,927, filed January 27, 2022, and U.S. Provisional Application No. 63/367,025, filed June 24, 2022. The contents of the aforementioned applications are hereby incorporated by reference in their entirety.

BACKGROUND

Integration of a nucleic acid of interest into a genome occurs at low frequency and with little site specificity, in the absence of a specialized protein to promote the insertion event. Some existing approaches, like CRISPR/Cas9, are more suited for small edits that rely on host repair pathways, and are less effective at integrating longer sequences. Other existing approaches, like Cre/loxP, require a first step of inserting a loxP site into the genome and then a second step of inserting a sequence of interest into the loxP site. There is a need in the art for improved compositions (e.g., proteins and nucleic acids) and methods for inserting, altering, or deleting sequences of interest in a genome.

PKU is an inherited disorder involving an autosomal recessive inborn error of metabolism caused by a deficiency in the hepatic enzyme PAH. PAH catalyzes the hydroxylation of phenylalanine to tyrosine, the rate-limiting step in phenylalanine metabolism. The reaction is dependent on tetrahydrobiopterin (BH4), as a cofactor, molecular oxygen, and iron. Loss-of-function mutations in one, or both, copies of the PAH gene lead to a non-functional, or less efficient enzyme. This ultimately results in phenotypically severe forms of PKU where phenylalanine in the blood can accumulate to toxic concentrations, with impaired levels of plasma tyrosine.

Additionally, the deficiency prevents normal synthesis of downstream products, including dopamine, norepinephrine, and melanin.

The *PAH* genomic sequence and its flanking regions span about 171 kb, containing 13 exons. Study of pathogenic allelic variants have identified more than 500 different disease-causing mutations in the *PAH* gene (Mitchell, *et al. Genet Med*. 2011; 13:697-707). Of these mutations, approximately 62% have been characterized as missense, 13% deletions, 11% splice, 6% silent, 5% nonsense, 2% insertion, and < 1% deletion or duplication of exons. The identification of several PAH mutations have been described for their effects on enzymatic activity using enzyme kinetics and crystallographic studies. Mutations affecting the catalytic binding mode, including Y138F, S23A, and Y377F, were observed with reduced propensity for tetramer formation (Flydal, *et al*. *PNAS*. 2019; 116(23):11229-34). Other residues that interact with BH_4 in the precatalytic conformation (amino acids 245–255, 286, 322, and 325) also interact with BH_4 in the catalytic conformation, and, in addition, these sites are actually associated with severe destabilization of PAH.

Naturally occurring N-terminal PAH mutations have been determined to be distributed in a nonrandom pattern, clustering within residues 46-48 (GAL motif) and 65-69 (IESRP motif (SEQ ID NO: 37634)), both motifs highly conserved in pyruvate dehydrogenase (PDH) (Gjetting, *et al*. *Am./ J. Hum. Genet.* 2001; 68:1353-60). Structure-function studies demonstrated that mutations in these regions drastically reduced phenylalanine binding. Most missense mutations identified in PKU to date result in phenotypic outcomes associated with misfolding of the PAH enzyme, increased protein turnover, and loss of enzymatic function. Residues in exons 7-9 and in interdomain regions within the subunit appear to play an important structural role and constitute hotspots for destabilization. Additionally, using recombinant forms of hPAH, mutations in BH_4 responsive domains, including R408W and Y414C showed residual activity, but had perturbed allostery suggesting altered protein conformation (Gersting, *et al*. *Hum. Genet*. 2008; 83:5-17). Mutation analyses and structure-function analyses have identified a robust genotype-phenotype mapping for PAH's role in PKU; however, outside of lifetime symptom management strategies, there has not been a successful cure.

Dietary therapy of phenylalanine (Phe) remains to be the mainstay treatment for PKU since its introduction in 1953. In the 1970s, tetrahydrobiopterin (BH_4) and neurotransmitter precursor (L-dopa/carbidopa and 5-hydroxytryptophan) combination therapy showed promise in modulating

PKU. Since its institution as a therapy, synthetics such as sapropterin have been formulated for as small molecule isomers of BH_4. Although, this form of therapy is generally only useful in patients with mild subsets of PAH-deficient PKU. It is thought that the therapy responsiveness is associated with mutations in the PAH gene resulting in some residual enzyme activity. At high blood concentrations, Phe in the blood will compete with other large neutral amino acids (LNAAs) for transport across the blood-brain barrier. LNAA supplementation has been shown to reduce cerebral Phe concentrations despite the observed increase in plasma Phe levels. Likewise, dietary supplementation with glycomacropeptides (GMP) has been observed to significantly reduce ureagenesis, improved protein retention, and Phe utilization. Although, these strategies do little to address the increased blood levels of Phe or the genotypic drivers.

Modern non-dietary approaches include the development of PAH-based fusion proteins and enzyme substitution therapies. Enzyme substitution therapies can include administration of phenylalanine ammonia-lyase (PAL) to a patient. PAL is an enzyme which catalyzes the conversion of Phe to transcinnamic acid and insignificant amounts of ammonia. Early studies using PAL administered in enteric-coated gelatin capsules to PKU patients, showed reductions in Phe levels; however, repeated dosing *in vivo* resulted in mounting of immune responses. Although, these approaches are not practical from a clinical perspective as several intravenous injections would be required due to the limited half-life of circulating enzymes. Gene therapy has shown some promise, for example using viral vectors, in rescuing PAH functionality. However, the efficacy of this strategy is hampered by the very low gene transfer rate and transient transgene expression. Accordingly, there is a need for new and more effective treatments for targeting *PAH* in PKU.

SUMMARY OF THE INVENTION

This disclosure relates to novel compositions, systems, and methods for altering a genome at one or more locations in a host cell, tissue, or subject, *in vivo* or *in vitro*. The disclosure provides gene modifying systems that are capable of modulating (e.g., inserting, altering, or deleting sequences of interest) phenylalanine hydroxylase (PAH) activity and methods of treating phenylketonuria (PKU) by administering one or more such systems to alter a genomic sequence, such as to correct mutations, within the *PAH* gene on the human chromosome 12q23.2 involved as a genetic driver in PKU.

In one aspect, the disclosure relates to a system for modifying DNA to correct a human PAH gene mutation causing PKU comprising (a) a nucleic acid encoding a gene modifying polypeptide capable of target primed reverse transcription, the polypeptide comprising (i) a reverse transcriptase domain and (ii) a Cas9 nickase that binds DNA and has endonuclease activity, and (b) a template RNA comprising (i) a gRNA spacer that is complementary to a first portion of the human PAH gene, (ii) a gRNA scaffold that binds the polypeptide, (iii) a heterologous object sequence comprising a mutation region to correct the mutation, and (iv) a primer binding site (PBS) sequence comprising at least 3, 4, 5, 6, 7, or 8 bases of 100% homology to a target DNA strand at the 3´ end of the template RNA. In some embodiments, the PAH gene may comprise a R408W mutation. In some embodiments, the PAH gene may comprise a R261Q mutation. In some embodiments, the PAH gene may comprise a R243Q mutation. In some embodiments, the PAH gene may comprise a IVS10-11G>A mutation. The template RNA sequence may comprise a sequence described herein, e.g., in Table 1A, 1B, 1C, 1D, 3A, 3B, 3C, 3D, 4A, 4B, 4C, 4D, 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A.

The gRNA spacer may comprise at least 15 bases of 100% homology to the target DNA at the 5´ end of the template RNA. The template RNA may further comprise a PBS sequence comprising at least 5 bases of at least 80% homology to the target DNA strand. The template RNA may comprise one or more chemical modifications.

The domains of the gene modifying polypeptide may be joined by a peptide linker. The polypeptide may comprise one or more peptide linkers. The gene modifying polypeptide may further comprise a nuclear localization signal. The polypeptide may comprise more than one nuclear localization signal, e.g., multiple adjacent nuclear localization signals or one or more nuclear localization signals in different regions of the polypeptide, e.g., one or more nuclear localization signals in the N-terminus of the polypeptide and one or more nuclear localization signals in the C-terminus of the polypeptide. The nucleic acid encoding the gene modifying polypeptide may encode one or more intein domains.

Introduction of the system into a target cell may result in insertion of at least 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 150, 200, 250, 300, 350, 400, 500, or 1000 base pairs of exogenous DNA. Introduction of the system into a target cell may result in deletion, wherein the deletion is less than 2, 3, 4, 5, 10, 50, or 100 base pairs of genomic DNA

upstream or downstream of the insertion. Introduction of the system into a target cell may result in substitution, e.g., substitution of 1, 2, or 3 nucleotides, e.g., consecutive nucleotides.

The heterologous object sequence may be at least 5, 10, 25, 50, 100, 150, 200, 250, 300, 400, 500, 600, or 700 base pairs.

In one aspect, the disclosure relates to a pharmaceutical composition comprising the system described above and a pharmaceutically acceptable excipient or carrier, wherein the pharmaceutically acceptable excipient or carrier is selected from the group consisting of a plasmid vector, a viral vector, a vesicle, and a lipid nanoparticle. In one aspect, the disclosure relates to a pharmaceutical composition comprising the system described above and multiple pharmaceutically acceptable excipients or carriers, wherein the pharmaceutically acceptable excipients or carriers are selected from the group consisting of a plasmid vector, a viral vector, a vesicle, and a lipid nanoparticle, e.g., where the system described above is delivered by two distinct excipients or carriers, e.g., two lipid nanoparticles, two viral vectors, or one lipid nanoparticle and one viral vector. The viral vector may be an adeno-associated virus (AAV).

In one aspect, the disclosure relates to a host cell (e.g., a mammalian cell, e.g., a human cell) comprising the system described above.

In one aspect, the disclosure relates to a method of correcting a mutation in the human PAH gene in a cell, tissue or subject, the method comprising administering the system described above to the cell, tissue or subject, wherein optionally the correction of the mutant PAH gene comprises an amino acid substitution of W408R, Q261R, and/or Q243R (reversing the pathogenic substitution which is R408W, R261Q, or R243Q). In another aspect, the correction of the mutant PAH gene comprises a nucleic acid substitution of IVS10-11A>G (reversing the pathogenic substitution which is IVS10-11G>A). The system may be introduced *in vivo*, *in vitro*, *ex vivo*, or *in situ*. The nucleic acid of (a) may be integrated into the genome of the host cell. In some embodiments, the nucleic acid of (a) is not integrated into the genome of the host cell. In some embodiments, the heterologous object sequence is inserted at only one target site in the host cell genome. The heterologous object sequence may be inserted at two or more target sites in the host cell genome, e.g., at the same corresponding site in two homologous chromosomes or at two different sites on the same or different chromosomes. The heterologous object sequence may encode a mammalian polypeptide, or a fragment or a variant thereof. The components of the system may be delivered on 1, 2, 3, 4, or more distinct nucleic acid molecules.

The system may be introduced into a host cell by electroporation or by using at least one vehicle selected from a plasmid vector, a viral vector, a vesicle, and a lipid nanoparticle.

Features of the compositions or methods can include one or more of the following enumerated embodiments.

Enumerated Embodiments

1. A template RNA comprising, e.g., from 5’ to 3’:

(i) a gRNA spacer that is complementary to a first portion of the human PAH gene, wherein the gRNA spacer has a sequence comprising the core nucleotides of a gRNA spacer sequence of Table 1A, Table 1B, Table 1C, or Table 1D, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3’ end of the flanking nucleotides of the gRNA spacer (e.g., comprises one or more flanking nucleotides that are adjacent to the core nucleotides), or wherein the gRNA spacer has a sequence of a spacer chosen from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A;

(ii) a gRNA scaffold that binds a gene modifying polypeptide (e.g., binds the Cas domain of the gene modifying polypeptide),

(iii) a heterologous object sequence comprising a mutation region to introduce a mutation into (e.g., to correct a mutation in) a second portion of the human PAH gene (wherein optionally the heterologous object sequence comprises, from 5’ to 3’, a post-edit homology region, a mutation region, and a pre-edit homology region), and

(iv) a primer binding site (PBS) sequence comprising at least 3, 4, 5, 6, 7, or 8 bases with 100% identity to a third portion of the human PAH gene.

2. The template RNA of embodiment 1, wherein the heterologous object sequence comprises the core nucleotides of an RT template sequence from Table 3A, Table 3B, Table 3C, or Table 3D, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3’ end of the flanking nucleotides of the RT template sequence, or wherein the heterologous object sequence comprises a sequence of an RT template sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A.

3. The template RNA of embodiment 1, wherein the heterologous object sequence comprises the core nucleotides of the RT template sequence of Table 3A, Table 3B, Table 3C, or Table 3D that corresponds to the gRNA spacer sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the RT template sequence (e.g., comprises one or more flanking nucleotides that are adjacent to the core nucleotides), or wherein the heterologous object sequence comprises a sequence of an RT template sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A.

4. The template RNA according to any one of embodiments 1-3 wherein the PBS sequence has a sequence comprising the core nucleotides of the PBS sequence from the same row of Table 3A, Table 3B, Table 3C, or Table 3D as the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 5' end of the flanking nucleotides of the PBS sequence (e.g., comprises one or more flanking nucleotides that are adjacent to the core nucleotides).

5. The template RNA according to any one of embodiments 1-3, wherein the PBS sequence has a sequence comprising the core nucleotides of a PBS sequence of Table 3A, Table 3B, Table 3C, or Table 3D that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, the gRNA spacer sequence, or both, and optionally comprises one or more consecutive nucleotides starting with the 5' end of the flanking nucleotides of the PBS sequence, or wherein the PBS sequence comprises a PBS sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, the gRNA spacer sequence, or both.

6. The template RNA according to any of embodiments 1-5, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

7. The template RNA according to any of embodiments 1-5, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12 that corresponds to the RT template sequence, the gRNA spacer sequence, or both, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

8. A template RNA comprising, e.g., from 5' to 3':

(i) a gRNA spacer that is complementary to a first portion of the human PAH gene,

(ii) a gRNA scaffold that binds a gene modifying polypeptide (e.g., binds the Cas domain of the gene modifying polypeptide),

(iii) a heterologous object sequence comprising a mutation region to introduce a mutation into a second portion of the human PAH gene, wherein the heterologous object sequence comprises the core nucleotides of an RT template sequence of Table 3A, Table 3B, Table 3C, or Table 3D, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the RT template sequence, or wherein the heterologous object sequence comprises an RT template sequence of Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A; and

(iv) a PBS sequence comprising at least 3, 4, 5, 6, 7, or 8 bases of 100% identity to a third portion of the human PAH gene.

9. The template RNA of embodiment 8, wherein the gRNA spacer comprises the core nucleotides of a gRNA spacer sequence of Table 1A, Table 1B, Table 1C, or Table 1D, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the gRNA spacer sequence, or wherein the gRNA spacer comprises a gRNA spacer sequence of Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A.

10. The template RNA of any one of embodiments 1-9, wherein the gRNA spacer comprises ACCTCAATCCTTTGGGTGTA (SEQ ID NO: 16355), or a sequence having 1, 2, or 3 substitutions thereto.

11. The template RNA of any one of embodiments 1-9, wherein the gRNA spacer comprises CCTCAATCCTTTGGGTGTAT (SEQ ID NO: 16332) , or a sequence having 1, 2, or 3 substitutions thereto.

12. The template RNA of any one of embodiments 1-9, wherein the gRNA spacer comprises TGGGTCGTAGCGAACTGAGA (SEQ ID NO: 16102), or a sequence having 1, 2, or 3 substitutions thereto.

13. The template RNA of any one of embodiments 1-9, wherein the gRNA spacer comprises GGGTCGTAGCGAACTGAGAA (SEQ ID NO: 16084), or a sequence having 1, 2, or 3 substitutions thereto.

14. The template RNA of any one of embodiments 1-9, wherein the gRNA spacer comprises TAGCGAACTGAGAAGGGCCA (SEQ ID NO: 16011), or a sequence having 1, 2, or 3 substitutions thereto.

15. The template RNA of any one of embodiments 1-9, wherein the gRNA spacer comprises ACTTTGCTGCCACAATACCT (SEQ ID NO: 16032), or a sequence having 1, 2, or 3 substitutions thereto.

16. The template RNA of embodiment 8, wherein the heterologous object sequence comprises the core nucleotides of the gRNA spacer sequence of Table 1A, Table 1B, Table 1C, or Table 1D that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3’ end of the flanking nucleotides of the gRNA spacer sequence, or wherein the heterologous object sequence comprises the nucleotides of the gRNA spacer sequence of Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto.

17. The template RNA according to any one of embodiments 8-16, wherein the PBS sequence has a sequence comprising the core nucleotides of the PBS sequence from the same

row of Table 3A, Table 3B, Table 3C, or Table 3D as the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 5' end of the flanking nucleotides of the PBS sequence.

18. The template RNA according to any one of embodiments 8-16, wherein the PBS sequence has a sequence comprising the core nucleotides of a PBS sequence of Table 3A, Table 3B, Table 3C, or Table 3D that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, the gRNA spacer sequence, or both, and optionally comprises one or more consecutive nucleotides starting with the 5' end of the flanking nucleotides of the PBS sequence, or wherein the PBS sequence has a sequence comprising the a PBS sequence of Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A that corresponds to the RT template sequence, the gRNA spacer sequence, or both.

19. The template RNA according to any of embodiments 8-18, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

20. The template RNA according to any of embodiments 8-18, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12 that corresponds to the RT template sequence, the gRNA spacer sequence, or both, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

21. A gene modifying system for modifying DNA, comprising:

(a) a first RNA comprising, from 5' to 3, (i) a guide RNA sequence that is complementary to a first portion of the human PAH gene, wherein the guide RNA sequence has a sequence comprising the core nucleotides of a spacer sequence of Table 1A, Table 1B, Table 1C, or Table 1D, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the guide RNA sequence, or wherein the guide RNA sequence has a sequence of a spacer chosen from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A; and (ii) a sequence (e.g., a

scaffold region) that binds a gene modifying polypeptide (e.g., binds the Cas domain of the gene modifying polypeptide), and

(b) a second RNA comprising (iii) a heterologous object sequence comprising a nucleotide substitution to introduce a mutation into a second portion of the human PAH gene (wherein optionally the heterologous object sequence comprises, from 5' to 3', a post-edit homology region, a mutation region, and a pre-edit homology region), (iv) a primer region comprising at least 5, 6, 7, or 8 bases of 100% identity to a third portion of the human PAH gene, and (v) an RRS (RNA binding protein recognition sequence) that binds a gene modifying protein.

22. The gene modifying system of embodiment 21, wherein the heterologous object sequence comprises the core nucleotides of an RT template sequence from Table 3A, Table 3B, Table 3C, or Table 3D, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the RT template sequence, or wherein the heterologous object sequence comprises a sequence of an RT template sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A, or a sequence having 1, 2, or 3 substitutions thereto.

23. The gene modifying system of embodiment 21, wherein the heterologous object sequence comprises the core nucleotides of the RT template sequence of Table 3A, Table 3B, Table 3C, or Table 3D that corresponds to the gRNA spacer sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the RT template sequence, or wherein the heterologous object sequence comprises a sequence of an RT template sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A that corresponds to the gRNA spacer sequence, or a sequence having 1, 2, or 3 substitutions thereto.

24. The gene modifying system of any one of embodiments 21-23, wherein the PBS sequence has a sequence comprising the core nucleotides of the PBS sequence from the same row of Table 3A, Table 3B, Table 3C, or Table 3D as the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive

nucleotides starting with the 5’ end of the flanking nucleotides of the PBS sequence, or wherein the PBS sequence has a sequence of a PBS sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A, or a sequence having 1, 2, or 3 substitutions thereto.

25. The gene modifying system of one of embodiments 21-23, wherein the PBS sequence has a sequence comprising the core nucleotides of a PBS sequence of Table 3A, Table 3B, Table 3C, or Table 3D that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, the gRNA spacer sequence, or both, and optionally comprises one or more consecutive nucleotides starting with the 5’ end of the flanking nucleotides of the PBS sequence, or wherein the PBS sequence has a sequence of a PBS sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto.

26. The gene modifying system of any one of embodiments 21-25, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

27. The gene modifying system of any one of embodiments 21-25, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12 that corresponds to the RT template sequence, the gRNA spacer sequence, or both, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

28. A gene modifying system for modifying DNA, comprising:

(a) a first RNA comprising, from 5’ to 3, (i) a guide RNA sequence that is complementary to a first portion of the human PAH gene, and (ii) a sequence (e.g., a scaffold region) that binds a gene modifying polypeptide (e.g., binds the Cas domain of the gene modifying polypeptide), and

(b) a second RNA comprising (iii) a heterologous object sequence comprising a nucleotide substitution to introduce a mutation into a second portion of the human PAH gene, wherein the heterologous object sequence comprises the core nucleotides of an RT template sequence of Table 3A, Table 3B, Table 3C, or Table 3D, or a sequence having 1, 2, or 3

substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the RT template sequence, or wherein the heterologous object sequence comprises an RT sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A, or a sequence having 1, 2, or 3 substitutions thereto, and (iv) a primer region comprising at least 5, 6, 7, or 8 bases of 100% homology to a third portion of the human PAH gene, and (v) an RRS (RNA binding protein recognition sequence) that binds a gene modifying protein.

29. The gene modifying system of embodiment 28, wherein the gRNA spacer comprises the core nucleotides of a gRNA spacer sequence of Table 1A, Table 1B, Table 1C, or Table 1D, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the gRNA spacer sequence, or wherein the gRNA spacer comprises a gRNA spacer sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A, or a sequence having 1, 2, or 3 substitutions thereto.

30. The gene modifying system of embodiment 28, wherein the heterologous object sequence comprises the core nucleotides of the gRNA spacer sequence of Table 1A, Table 1B, Table 1C, or Table 1D that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the gRNA spacer sequence, or wherein the heterologous object sequence comprises a gRNA spacer sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto.

31. The gene modifying system of any one of embodiments 28-30, wherein the PBS sequence has a sequence comprising the core nucleotides of the PBS sequence from the same row of Table 3A, Table 3B, Table 3C, or Table 3D as the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 5' end of the flanking nucleotides of the PBS sequence, or wherein the PBS sequence has a sequence comprising a PBS sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A, or a sequence having 1, 2, or 3 substitutions thereto.

32. The gene modifying system of any one of embodiments 28-30, wherein the PBS sequence has a sequence comprising the core nucleotides of a PBS sequence of Table 3A, Table 3B, Table 3C, or Table 3D that corresponds to the RT template sequence, the gRNA spacer sequence, or both, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 5' end of the flanking nucleotides of the PBS sequence, or wherein the PBS sequence has a sequence comprising a PBS sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A that corresponds to the RT template sequence, the gRNA spacer sequence, or both, or a sequence having 1, 2, or 3 substitutions thereto.

33. The gene modifying system of any one of embodiments 28-32, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

34. The gene modifying system of any one of embodiments 28-32, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12 that corresponds to the RT template sequence, the gRNA spacer sequence, or both, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

35. A gRNA comprising (i) a gRNA spacer sequence that is complementary to a first portion of the human PAH gene, wherein the gRNA spacer has a sequence comprising the core nucleotides of a gRNA spacer sequence of Table 1A, Table 1B, Table 1C, or Table 1D, Table 2A, Table 2B, Table 2C, or Table 2D, or Table 4A, Table 4B, Table 4C, or Table 4D, or a sequence having 1, 2, or 3 substitutions thereto and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the gRNA spacer sequence, or wherein the gRNA spacer has a sequence comprising a gRNA spacer sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A or a sequence having 1, 2, or 3 substitutions thereto; and (ii) a gRNA scaffold.

36. The gRNA of embodiment 35, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

37. The gRNA of embodiment 35, wherein the gRNA scaffold comprises a sequence of a gRNA scaffold of Table 12 that corresponds to the gRNA spacer sequence, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

38. A template RNA comprising: (iii) a heterologous object sequence comprising a mutation region to introduce a mutation into a second portion of the human PAH gene, wherein the heterologous object sequence comprises the core nucleotides of an RT template sequence of Table 3A, Table 3B, Table 3C, or Table 3D, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 3' end of the flanking nucleotides of the RT template sequence, or wherein the heterologous object sequence comprises an RT template sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A or a sequence having 1, 2, or 3 substitutions thereto, and (iv) a PBS sequence comprising at least 5, 6, 7, or 8 bases of 100% homology to a third portion of the human PAH gene.

39. The template RNA according to embodiment 38, wherein the PBS sequence has a sequence comprising the core nucleotides of the PBS sequence from the same row of Table 3A, Table 3B, Table 3C, or Table 3D as the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 5' end of the flanking nucleotides of the PBS sequence.

40. The template RNA according to embodiment 38, wherein the PBS sequence has a sequence comprising the core nucleotides of a PBS sequence of Table 3A, Table 3B, Table 3C, or Table 3D that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto, and optionally comprises one or more consecutive nucleotides starting with the 5' end of the flanking nucleotides of the PBS sequence, or wherein the PBS sequence comprises a PBS sequence from Tables 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A that corresponds to the RT template sequence, or a sequence having 1, 2, or 3 substitutions thereto.

41. The template RNA according to any one of embodiments 1-20 or 38-40, the gene modifying system of any one of embodiments 21-35, or the gRNA of any one of embodiments 35-37, wherein the mutation introduced by the system is a W408R, Q261R, Q243R, and/or IVS10-11A>G mutation (e.g., to correct a pathogenic R408W, R261Q, R243Q, and/or IVS10-11G>A mutation) of the PAH gene.

42. The template RNA according to any one of embodiments 1-20 or 38-41 or the gene modifying system of any one of embodiments 35-37 or 41, wherein the pre-edit sequence comprises between about 1 nucleotide to about 35 nucleotides (e.g., comprises about 1-5, 5-10, 10-15, 15-20, 20-25, 25-30, or 30-35 nucleotides) in length.

43. The template RNA according to any one of embodiments 1-20 or 38-42 or the gene modifying system of any one of embodiments 35-37, 41, or 42, wherein the mutation region comprises a single nucleotide.

44. The template RNA according to any one of embodiments 1-20 or 38-42 or the gene modifying system of any one of embodiments35-37, 41, or 42, wherein the mutation region is at least two nucleotides in length.

45. The template RNA according to any one of embodiments 1-20, 38-42, or 44 or the gene modifying system of any one of embodiments 35-37, 41, 42, or 44, wherein the mutation region is up to 32 (e.g., up to 5, 10, 15, 20, 25, 30, or 32) nucleotides in length and comprises one, two, or three sequence differences relative to a second portion of the human PAH gene.

46. The template RNA according to any one of embodiments 1-20, 38-42, 44, or 45 or the gene modifying system of any one of embodiments 35-37, 41, 42, 44, or 45, wherein the mutation region comprises two sequences differences relative to a second portion of the human PAH gene.

47. The template RNA according to any one of embodiments 1-20, 38-42, or 44-46 or the gene modifying system of any one of embodiments 35-37, 41, 42, or 44-46, wherein the

mutation region comprises a first region (e.g., a first nucleotide) designed to correct a pathogenic mutation in the PAH gene and a second region (e.g., a second nucleotide) designed to inactivate a PAM sequence (e.g., a "PAM-kill" mutation as described herein).

48. The template RNA according to any one of embodiments 1-20 or 38-46 or the gene modifying system of any one of embodiments 35-37 or 41-46, wherein the mutation region comprises less than 80%, 70%, 60%, 50%, 40%, or 30% identity to corresponding portion of the human PAH gene.

49. The template RNA of any one of the preceding embodiments, wherein the template RNA comprises one or more silent mutations (e.g., silent substitutions), e.g., as exemplified in Tables 7A-7C, 8A-8D, E6, or E6A.

50. The template RNA of any of the preceding embodiments, wherein the mutation region comprises a first region designed to correct a pathogenic mutation in the PAH gene and a second region designed to introduce a silent substitution.

51. The template RNA of any one of the preceding embodiments, which comprises one or more chemically modified nucleotides.

52. A gene modifying system comprising:

a template RNA of any of embodiments 1-20, 38-46, or a system of any of embodiments 35-37 or 41-46, and

a gene modifying polypeptide, or a nucleic acid (e.g., RNA) encoding the gene modifying polypeptide.

53. The gene modifying system of embodiment 52, wherein the gene modifying polypeptide comprises:

a reverse transcriptase (RT) domain (e.g., an RT domain from a retrovirus, or a polypeptide domain having at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% amino acids sequence identity thereto); and

a Cas domain that binds to the target DNA molecule and is heterologous to the RT domain (e.g., a Cas9 domain); and

optionally, a linker disposed between the RT domain and the Cas domain.

54. The gene modifying system of embodiment 53, wherein the RT domain comprises:

(a) an RT domain of Table 6; or

(b) an RT domain from a murine leukemia virus (MMLV), a porcine endogenous retrovirus (PERV); Avian reticuloendotheliosis virus (AVIRE), a feline leukemia virus (FLV), simian foamy virus (SFV) (e.g., SFV3L), bovine leukemia virus (BLV), Mason-Pfizer monkey virus (MPMV), human foamy virus (HFV), or bovine foamy/syncytial virus (BFV/BSV).

55. The gene modifying system of embodiment 53 or 54, wherein the Cas domain comprises a Cas domain of Table 7 or Table 8.

56. The gene modifying system of any one of embodiments 53-55, wherein the Cas domain:

(a) is a Cas9 domain;

(b) is a SpCas9 domain, a BlatCas9 domain, a Nme2Cas9 domain, a PnpCas9 domain, a SauCas9 domain, a SauCas9-KKH domain, a SauriCas9 domain, a SauriCas9-KKH domain, a ScaCas9-Sc++ domain, a SpyCas9 domain, a SpyCas9-NG domain, a SpyCas9-SpRY domain, or a St1Cas9 domain; and/or

(c) is a Cas9 domain comprising an N670A mutation, an N611A mutation, an N605A mutation, an N580A mutation, an N588A mutation, an N872A mutation, an N863 mutation, an N622A mutation, or an H840A mutation.

57. The gene modifying system of embodiment 56, wherein the Cas9 domain binds a PAM sequence listed in Table 7 or Table 12.

58. The gene modifying system of embodiment 57, wherein a second portion of the human PAH gene overlaps with a PAM recognized by the Cas domain, e.g., wherein the second portion of the human PAH gene is within the PAM or wherein the PAM is within the second portion of the human PAH gene).

59. The gene modifying system any one of embodiments 52-58, wherein the gRNA spacer is a gRNA spacer according to Table 1A, Table 1B, Table 1C, or Table 1D, and the Cas domain comprises a Cas domain listed in the same row of Table 1A, Table 1B, Table 1C, or Table 1D, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

60. The gene modifying system of any one of embodiments 52-58, wherein the template RNA comprises a sequence of a template RNA sequence of Table 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

61. The gene modifying system of any one of embodiments 52-60, wherein:

(a) the template RNA comprises a sequence of a template RNA sequence of Tables 3A-3D, 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A;

(b) the Cas domain comprises a Cas domain of Table 7 or Table 8;

(c) the linker comprises a linker sequence of Table 10 (e.g., of any of SEQ ID NOs: 5217, 5106, 5190, and 5218); and

(d) the gene modifying polypeptide comprises one or two NLS sequences from Table 11 (e.g., of any of SEQ ID NOs: 5245, 5290, 5323, 5330, 5349, 5350, 5351, and 4001).

62. The gene modifying system of any of embodiments 52-61, which produces a first nick in a first strand of the human PAH gene.

63. The gene modifying system of embodiment 62, which further comprises a second strand-targeting gRNA that directs a second nick to the second strand of the human PAH gene.

64. The gene modifying system of embodiment 63, wherein the second strand-targeting gRNA comprises:

(i) a sequence comprising the core nucleotides of a left gRNA spacer sequence or a right gRNA spacer sequence from Table 2A, Table 2B, Table 2C, or Table 2D, and optionally

comprises one or more consecutive nucleotides starting with the 3’ end of the flanking nucleotides of the left gRNA spacer sequence or right gRNA spacer sequence; or

(ii) a second -strand-targeting gRNA comprising a spacer sequence of Table 6A, or a spacer sequence having 1, 2, or 3 substitutions thereto.

65. The gene modifying system of embodiment 63, wherein the second strand-targeting gRNA comprises a sequence comprising the core nucleotides of a left gRNA spacer sequence or a right gRNA spacer sequence from Table 2A, Table 2B, Table 2C, or Table 2D that corresponds to the gRNA spacer sequence of (i), and optionally comprises one or more consecutive nucleotides starting with the 3’ end of the flanking nucleotides of the left gRNA spacer sequence or right gRNA spacer sequence.

66. The gene modifying system of embodiment 63, wherein the second strand-targeting gRNA comprises:

(i) a sequence comprising the core nucleotides of a second nick gRNA sequence from Table 4A, Table 4B, Table 4C, Table 4D, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto, and optionally comprises one or more consecutive nucleotides starting with the 3’ end of the flanking nucleotides of the second nick gRNA sequence; or

(ii) a second -strand-targeting gRNA comprising a spacer sequence from Table 6A or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

67. The gene modifying system of embodiment 63, wherein the second strand-targeting gRNA comprises a sequence comprising the core nucleotides of the second nick gRNA sequence from Table 4A, Table 4B, Table 4C, or Table 4D that corresponds to the gRNA spacer sequence of (i), or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto, and optionally comprises one or more consecutive nucleotides starting with the 3’ end of the flanking nucleotides of the second nick gRNA sequence.

68. The gene modifying system of any one of embodiments 52-67, wherein the second strand-targeting gRNA has a "PAM-in orientation" with the template RNA of the gene modifying system, e.g., as exemplified in Tables 2A-2D, 4A-4D, or 6A.

69. The gene modifying system of any one of embodiments 52-68, the second strand-targeting gRNA targets a sequence overlapping the target mutation of the template RNA.

70. The gene modifying system of embodiment 69, wherein second strand-targeting gRNA comprises:

(i) a sequence (e.g., a spacer sequence) complementary to the PAH mutation;

(ii) a sequence (e.g., a spacer sequence) complementary to the wild-type sequence at the target locus;

(iii) a sequence (e.g., a spacer sequence) complementary to a SNP proximal to the target locus, e.g., a SNP contained in the genomic DNA of a subject (e.g., a patient);

(iv) a sequence (e.g., spacer sequence) complementary to or comprising one or more silent substitutions proximal to the target locus.

71. The template RNA, gene modifying system, or gRNA, of any one of the preceding embodiments, wherein the gRNA spacer comprises about 1, 2, 3, or more flanking nucleotides of the gRNA spacer.

72. The template RNA or gene modifying system of any one of the preceding embodiments, wherein the heterologous object sequence comprises about 2, 3, 4, 5, 10, 20, 30, 40, or more flanking nucleotides of the RT template sequence.

73. The template RNA or gene modifying system, of any one of the preceding embodiments, wherein the heterologous object sequence comprises between about 8-30, 9-25, 10-20, 11-16, or 12-15 (e.g., about 11-16) nucleotides.

74. The template RNA or gene modifying system, of any one of the preceding embodiments, wherein the mutation region comprises 1, 2, or 3 nucleotide positions of sequence differences relative to the corresponding portion of the human PAH gene.

75. The template RNA or gene modifying system of any one of the preceding embodiments, wherein the mutation region comprises at least 2 nucleotide positions of sequence difference relative to the corresponding portion of the human PAH gene.

76. The template RNA or gene modifying system, of any one of the preceding embodiments, wherein the post-edit homology region and/or pre-edit homology region comprises 100% identity to the PAH gene.

77. The template RNA or gene modifying system of any one of the preceding embodiments, wherein the PBS sequence additionally comprises about 1, 2, 3, 4, 5, 6, 7, or more flanking nucleotides.

78. The template RNA or gene modifying system of any one of the preceding embodiments, wherein the PBS sequence comprises about 5-20, 8-16, 8-14, 8-13, 9-13, 9-12, or 10-12 (e.g., about 9-12) nucleotides.

79. The template RNA or gene modifying system of any one of the preceding embodiments, wherein the PBS sequence binds within 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 nucleotides of a nick site in the PAH gene.

80. The gene modifying system of any one of the preceding embodiments, wherein the domains of the gene modifying polypeptide are joined by a peptide linker.

81. The gene modifying system of embodiment 80, wherein the linker comprises a sequence of a linker of Table 10 (e.g., of any of SEQ ID NOs: 5217, 5106, 5190, and 5218).

82. The gene modifying system of any one of the preceding embodiments, wherein the gene modifying polypeptide further comprise one or more nuclear localization sequences (NLS).

83. The gene modifying system of embodiment 82, wherein the gene modifying polypeptide comprises a first NLS and a second NLS.

84. The gene modifying system of embodiment 82 or 83, wherein the NLS comprises a sequence of a NLS of Table 11 (e.g., of any of SEQ ID NOs: 5245, 5290, 5323, 5330, 5349, 5350, 5351, and 4001).

85. A template RNA comprising a sequence of a template RNA of Table 4A-4D, 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

86. A template RNA comprising a sequence of a template RNA of Tables 4A-4D, 5A-5F, 8A-8D, E3, E3A, BB, E5, E5A, E6, or E6A.

87. A gene modifying system comprising:

(i) a template RNA comprising a sequence of a template RNA of Table 4A, Table 4B, Table 4C, or Table 4D, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto; and

(ii) a second-nick gRNA sequence from the same row of Table 4A, Table 4B, Table 4C, or Table 4D as (i), a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

88. A gene modifying system comprising:

(i) a template RNA comprising a sequence of a template RNA of Table 4A, Table 4B, Table 4C, or Table 4D; and

(ii) a second-nick gRNA sequence from the same row of Table 4A, Table 4B, Table 4C, or Table 4D as (i).

89. A DNA encoding the template RNA of any one of embodiments 1-20, 38-48, 71-79, 85, or 86, or the gRNA of any one of embodiments 34-37.

90. A pharmaceutical composition, comprising the system of any one of embodiments 49-84, 87, or 88, or one or more nucleic acids encoding the same, and a pharmaceutically acceptable excipient or carrier.

91. The pharmaceutical composition of embodiment 90, wherein the pharmaceutically acceptable excipient or carrier is selected from the group consisting of a plasmid vector, a viral vector, a vesicle, and a lipid nanoparticle.

92. The pharmaceutical composition of embodiment 91, wherein the viral vector is an adeno-associated virus.

93. A host cell (e.g., a mammalian cell, e.g., a human cell) comprising the template RNA or gene modifying system of any one of the preceding embodiments.

94. A method of making the template RNA of any one of embodiments 1-20, 38-48, 71-79, 85, or 86, the method comprising synthesizing the template RNA by *in vitro* transcription (e.g., solid state synthesis) or by introducing a DNA encoding the template RNA into a host cell under conditions that allow for production of the template RNA.

95. A method for modifying a target site in the human PAH gene in a cell, the method comprising contacting the cell with the gene modifying system of any one of embodiments 49-84, 87, or 88, or DNA encoding the same, thereby modifying the target site in the human PAH gene in a cell.

96. A method for modifying a target site in the human PAH gene in a cell, the method comprising contacting the cell with: (i) the template RNA of any one of embodiments 49-84, 87, or 88, or DNA encoding the same; and (ii) a gene modifying polypeptide or a nucleic acid

encoding a gene modifying polypeptide, thereby modifying the target site in the human PAH gene in a cell.

97. A method for treating a subject having a disease or condition associated with a mutation in the human PAH gene, the method comprising administering to the subject the gene modifying system of any one of embodiments 49-84, 87, or 88, or DNA encoding the same, thereby treating the subject having a disease or condition associated with a mutation in the human PAH gene.

98. A method for treating a subject having a disease or condition associated with a mutation in the human PAH gene, the method comprising administering to the subject the template RNA of any one of embodiments 49-84, 87, or 88, or DNA encoding the same; and (ii) a gene modifying polypeptide or a nucleic acid encoding a gene modifying polypeptide, thereby treating the subject having a disease or condition associated with a mutation in the human PAH gene.

99. The method of embodiment 97 or 98, wherein the disease or condition is phenylketonuria (PKU).

100. The method of any one of embodiments 97-99, wherein the subject has a R408W, R261Q, R243Q, and/or IVS10-11G>A mutation.

101. A method for treating a subject having PKU the method comprising administering to the subject the gene modifying system of any one of embodiments 49-84, 87, or 88, or DNA encoding the same, thereby treating the subject having PKU.

102. A method for treating a subject having PKU the method comprising administering to the subject (i) the template RNA of any one of embodiments 49-84, 87, or 88, or DNA encoding the same, and (ii) a gene modifying polypeptide or a nucleic acid encoding a gene modifying polypeptide, thereby treating the subject having PKU.

103. The gene modifying system or method of any one of the preceding embodiments, wherein introduction of the system into a target cell results in a correction of a pathogenic mutation in the PAH gene.

104. The gene modifying system or method of any one of the preceding embodiments, wherein the pathogenic mutation is a W408R, Q261R, Q243R, and/or IVS10-11A>G mutation, and wherein the correction comprises an amino acid substitution of R408W, R261Q, or R243Q, or a nucleic acid substitution of IVS10-11G>A.

105. The gene modifying system or method of any of the preceding embodiments, wherein correction of the mutation occurs in at least 30% (e.g., 30%, 40%, 50%, 60%, 70%, or more) of target nucleic acids.

106. The gene modifying system or method of any of the preceding embodiments, wherein correction of the mutation occurs in at least 30% (e.g., 30%, 40%, 50%, 60%, 70%, or more) of target cells.

107. The gene modifying system or method of any of the preceding embodiments, wherein the gene modifying system comprises a second strand-targeting gRNA, and wherein correction of the mutation in a population of target cells is increased relative to a population of target cells treated with a gene modifying system comprising a template RNA without a second strand-targeting gRNA.

108. The gene modifying system or method of any of the preceding embodiments, wherein the template RNA comprises one or more silent substitutions (e.g., as exemplified in Tables 7A, X4, and X4A), and wherein correction of the mutation in a population of target cells is increased relative to a population of target cells treated with a gene modifying system comprising a template RNA that does not comprise one or more silent substitutions.

109. The method of any of the preceding embodiments, wherein the cell is a mammalian cell, such as a human cell.

110. The method of any one of the preceding embodiments, wherein the subject is a human.

111. The method of any of the preceding embodiments, wherein the contacting occurs *ex vivo*, e.g., wherein the cell's or subject's DNA is modified *ex vivo*.

112. The method of any of the preceding embodiments, wherein the contacting occurs *in vivo*, e.g., wherein the cell's or subject's DNA is modified *in vivo*.

113. The method of any of the preceding embodiments, wherein contacting the cell or the subject with the system comprises contacting the cell or a cell within the subject with a nucleic acid (e.g., DNA or RNA) encoding the gene modifying polypeptide under conditions that allow for production of the gene modifying polypeptide.

Additional Enumerated Embodiments

A1. A template RNA comprising, from 5' to 3':

(i) a gRNA spacer that is complementary to a first portion of the human PAH gene, wherein the gRNA spacer has a nucleotide sequence comprising ACCTCAATCCTTTGGGTGTA (SEQ ID NO: 16355), or a nucleotide sequence having 1, 2, or 3 substitution thereto;

(ii) a gRNA scaffold that binds a Cas domain of a gene modifying polypeptide,

(iii) a heterologous object sequence comprising a mutation region to correct a mutation in a second portion of the human PAH gene, and

(iv) a primer binding site (PBS) sequence comprising at least 5 bases with 100% identity to a third portion of the human PAH gene.

A2. The template RNA of embodiment A1, wherein the gRNA spacer has a nucleotide sequence comprising ACCTCAATCCTTTGGGTGTA (SEQ ID NO: 16355).

A3. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 30 nucleotides from the 3' end of a sequence

according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttctcagttcgctacgacccatac (SEQ ID NO: 24984), or a sequence having 1, 2, 3, or 4 substitutions thereto.

A4. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttctcagttcgctacgacccatac (SEQ ID NO: 24984), or comprises at least 40, 50, 60, or 70 nucleotides from the 3' end of said sequence, or a sequence having 1, 2, 3, or 4 substitutions thereto.

A5. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 30 nucleotides from the 3' end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttctcagttcgctacgacccatac (SEQ ID NO: 24984).

A6. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttctcagttcgctacgacccatac (SEQ ID NO: 24984), or comprises at least 40, 50, 60, or 70 nucleotides from the 3' end of said sequence.

A7. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of at least 5, 6, 7, or 8 nucleotides from the 5' end of a sequence according to acccaaagg, or a sequence having 1 substitution thereto.

A8. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of acccaaagg

A9. A template RNA comprising, from 5' to 3':

(i) a gRNA spacer that is complementary to a first portion of the human PAH gene, wherein the gRNA spacer has a nucleotide sequence comprising CCTCAATCCTTTGGGTGTAT (SEQ ID NO: 16332), or a nucleotide sequence having 1, 2, or 3 substitution thereto;

(ii) a gRNA scaffold that binds a Cas domain of a gene modifying polypeptide,

(iii) a heterologous object sequence comprising a mutation region to correct a mutation in a second portion of the human PAH gene, and

(iv) a primer binding site (PBS) sequence comprising at least 5 bases with 100% identity to a third portion of the human PAH gene.

A10. The template RNA of embodiment A9, wherein the gRNA spacer has a nucleotide sequence comprising CCTCAATCCTTTGGGTGTAT (SEQ ID NO: 16332).

A11. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 50 nucleotides from the 3' end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttctcagttcgctacgacccata (SEQ ID NO: 24975), or a sequence having 1, 2, 3, or 4 substitutions thereto.

A12. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttctcagttcgctacgacccata (SEQ ID NO: 24975), or comprises at least 60 or 70 nucleotides from the 3' end of said sequence, or a sequence having 1, 2, 3, or 4 substitutions thereto.

A13. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 50 nucleotides from the 3' end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttctcagttcgctacgacccata (SEQ ID NO: 24975).

A14. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttctcagttcgctacgacccata (SEQ ID NO: 24975), or comprises at least 60 or 70 nucleotides from the 3' end of said sequence.

A15. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of at least 5, 6, 7, or 8 nucleotides from the 5' end of a sequence according to cacccaaag, or a sequence having 1 substitution thereto.

A16. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of cacccaaag.

A17. A template RNA comprising, from 5' to 3':

(i) a gRNA spacer that is complementary to a first portion of the human PAH gene, wherein the gRNA spacer has a nucleotide sequence comprising TGGGTCGTAGCGAACTGAGA (SEQ ID NO: 16102), or a nucleotide sequence having 1, 2, or 3 substitution thereto;

(ii) a gRNA scaffold that binds a Cas domain of a gene modifying polypeptide,

(iii) a heterologous object sequence comprising a mutation region to correct a mutation in a second portion of the human PAH gene, and

(iv) a primer binding site (PBS) sequence comprising at least 5 bases with 100% identity to a third portion of the human PAH gene.

A18. The template RNA of embodiment A17, wherein the gRNA spacer has a nucleotide sequence comprising TGGGTCGTAGCGAACTGAGA (SEQ ID NO: 16102).

A19. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 10 nucleotides from the 3' end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttct (SEQ ID NO: 24863), or a sequence having 1, 2, 3, or 4 substitutions thereto.

A20. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttct (SEQ ID NO: 24863), or comprises at least 20, 30, 40, of 50 nucleotides from the 3' end of said sequence, or a sequence having 1, 2, 3, or 4 substitutions thereto.

A21. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 10 nucleotides from the 3' end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttct (SEQ ID NO: 24863).

A22. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttct (SEQ ID NO: 24863), or comprises at least 20, 30, 40, of 50 nucleotides from the 3' end of said sequence.

A23. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of at least 5, 6, 7, or 8 nucleotides from the 5' end of a sequence according to cagttcgct, or a sequence having 1 substitution thereto.

A24. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of cagttcgct.

A25. A template RNA comprising, from 5' to 3':

(i) a gRNA spacer that is complementary to a first portion of the human PAH gene, wherein the gRNA spacer has a nucleotide sequence comprising GGGTCGTAGCGAACTGAGAA (SEQ ID NO: 16084), or a nucleotide sequence having 1, 2, or 3 substitution thereto;

(ii) a gRNA scaffold that binds a Cas domain of a gene modifying polypeptide,

(iii) a heterologous object sequence comprising a mutation region to correct a mutation in a second portion of the human PAH gene, and

(iv) a primer binding site (PBS) sequence comprising at least 5 bases with 100% identity to a third portion of the human PAH gene.

A26. The template RNA of embodiment A25, wherein the gRNA spacer has a nucleotide sequence comprising GGGTCGTAGCGAACTGAGAA (SEQ ID NO: 16084).

A27. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 9 nucleotides from the 3’ end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttc (SEQ ID NO: 24856), or a sequence having 1, 2, 3, or 4 substitutions thereto.

A28. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttc (SEQ ID NO: 24856), or comprises at least 10, 20, 30, 40, or 50 nucleotides from the 3’ end of said sequence, or a sequence having 1, 2, 3, or 4 substitutions thereto.

A29. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 9 nucleotides from the 3’ end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttc (SEQ ID NO: 24856).

A30. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCggcccttc (SEQ ID NO: 24856), or comprises at least 10, 20, 30, 40, or 50 nucleotides from the 3’ end of said sequence.

A31. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of at least 5, 6, 7, or 8 nucleotides from the 5’ end of a sequence according to tcagttcgc, or a sequence having 1 substitution thereto.

A32. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of tcagttcgc

A33. A template RNA comprising, from 5’ to 3’:

(i) a gRNA spacer that is complementary to a first portion of the human PAH gene, wherein the gRNA spacer has a nucleotide sequence comprising

TAGCGAACTGAGAAGGGCCA (SEQ ID NO: 16011), or a nucleotide sequence having 1, 2, or 3 substitution thereto;

(ii) a gRNA scaffold that binds a Cas domain of a gene modifying polypeptide,

(iii) a heterologous object sequence comprising a mutation region to correct a mutation in a second portion of the human PAH gene, and

(iv) a primer binding site (PBS) sequence comprising at least 5 bases with 100% identity to a third portion of the human PAH gene.

A34. The template RNA of embodiment A33, wherein the gRNA spacer has a nucleotide sequence comprising TAGCGAACTGAGAAGGGCCA (SEQ ID NO: 16011).

A35. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 3 nucleotides from the 3’ end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCgg (SEQ I DNO: 24817), or a sequence having 1, 2, 3, or 4 substitutions thereto.

A36. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCgg (SEQ I DNO: 24817), or comprises at least 5, 10, 20, 30, 40, or 50 nucleotides from the 3’ end of said sequence, or a sequence having 1, 2, 3, or 4 substitutions thereto.

A37. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 3 nucleotides from the 3’ end of a sequence according to tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCgg (SEQ I DNO: 24817).

A38. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of tcactcaagcctgtggttttggtcttaggaactttgctgccacaatacctCgg (SEQ ID NO: 24817), or comprises at least 5, 10, 20, 30, 40, or 50 nucleotides from the 3’ end of said sequence.

A39. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of at least 5, 6, 7, or 8 nucleotides from the 5’ end of a sequence according to cccttctca, or a sequence having 1 substitution thereto.

A40. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of cccttctca.

A41. A template RNA comprising, from 5’ to 3’:

(i) a gRNA spacer that is complementary to a first portion of the human PAH gene, wherein the gRNA spacer has a nucleotide sequence comprising ACTTTGCTGCCACAATACCT (SEQ ID NO: 16032), or a nucleotide sequence having 1, 2, or 3 substitution thereto;

(ii) a gRNA scaffold that binds a Cas domain of a gene modifying polypeptide,

(iii) a heterologous object sequence comprising a mutation region to correct a mutation in a second portion of the human PAH gene, and

(iv) a primer binding site (PBS) sequence comprising at least 5 bases with 100% identity to a third portion of the human PAH gene.

A42. The template RNA of embodiment A41, wherein the gRNA spacer has a nucleotide sequence comprising ACTTTGCTGCCACAATACCT (SEQ ID NO: 16032).

A43. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 4 nucleotides from the 3’ end of a sequence according to caagacctcaatcctttgggtgtatgggtcgtagcgaactgagaagggccGagg (SEQ ID NO: 24825), or a sequence having 1, 2, 3, or 4 substitutions thereto.

A44. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of caagacctcaatcctttgggtgtatgggtcgtagcgaactgagaagggccGagg (SEQ ID NO: 24825), or comprises at least 5, 10, 20, 30, 40, or 50 nucleotides from the 3’ end of said sequence, or a sequence having 1, 2, 3, or 4 substitutions thereto.

A45. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of at least 4 nucleotides from the 3’ end of a sequence according to caagacctcaatcctttgggtgtatgggtcgtagcgaactgagaagggccGagg (SEQ ID NO: 24825).

A46. The template RNA of any of the preceding embodiments, wherein the heterologous object sequence comprises a sequence of caagacctcaatcctttgggtgtatgggtcgtagcgaactgagaagggccGagg (SEQ ID NO: 24825), or comprises at least 5, 10, 20, 30, 40, or 50 nucleotides from the 3’ end of said sequence.

A47. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of at least 5, 6, 7, 8, 9, 10, or 15 nucleotides from the 5’ end of a sequence according to tattgtggcagcaaagt (SEQ ID NO: 37633), or a sequence having 1 substitution thereto.

A48. The template RNA of any of the preceding embodiments, wherein the PBS comprises a sequence of tattgtggcagcaaagt (SEQ ID NO: 37633).

A49. The template RNA of any of the preceding embodiments, wherein the gRNA scaffold has a sequence according to GTTTTAGAGCTAGAAATAGCAAGTTAAAATAAGGCTAGTCCGTTATCAACTTGAAAA AGTGGCACCGAGTCGGTGC (SEQ ID NO: 37627), or a sequence having at least 90% identity thereto.

A50. The template RNA of any of the preceding embodiments, wherein the gRNA scaffold has a sequence according to GTTTTAGAGCTAGAAATAGCAAGTTAAAATAAGGCTAGTCCGTTATCAACTTGAAAA AGTGGCACCGAGTCGGTGC (SEQ ID NO: 37627).

A51. The template RNA of any of the preceding embodiments, wherein the mutation region comprises a single nucleotide.

A52. The template RNA of any of embodiments A1-51, wherein the mutation region is at least two nucleotides in length.

A53. The template RNA of any of the preceding embodiments, wherein the mutation region is up to 20 nucleotides in length and comprises one, two, or three sequence differences relative to the second portion of the human PAH gene.

A54. The template RNA of any of embodiments A1-53, wherein the mutation region comprises a first region designed to correct a pathogenic mutation in the PAH gene and a second region designed to inactivate a PAM sequence.

A55. The template RNA of any of embodiments A1-54, wherein the mutation region comprises a first region designed to correct a pathogenic mutation in the PAH gene and a second region designed to introduce a silent substitution.

A56. The template RNA of any of the preceding embodiments, which is configured to edit a pathogenic R408W mutation in the human PAH gene.

A57. The template RNA of embodiment A56, which is configured to convert an R408W mutation to arginine.

A58. The template RNA of any of the preceding embodiments, which comprises one or more chemically modified nucleotides.

A59. A gene modifying system comprising:
a template RNA of any of the preceding embodiments, and
a gene modifying polypeptide, or a nucleic acid encoding the gene modifying polypeptide.

A60. The gene modifying system of embodiment A59, wherein the gene modifying polypeptide comprises an RT domain having a sequence according to SEQ ID NO: 8,003, or a sequence having at least 70%, 80%, 85%, 90%, 95%, 98%, or 99% identity thereto.

A61. The gene modifying system of embodiment A59, wherein the gene modifying polypeptide comprises an RT domain having a sequence according to SEQ ID NO: 8,020, or a sequence having at least 70%, 80%, 85%, 90%, 95%, 98%, or 99% identity thereto.

A62. The gene modifying system of embodiment 5A9, wherein the gene modifying polypeptide comprises an RT domain having a sequence according to SEQ ID NO: 8,074, or a sequence having at least 70%, 80%, 85%, 90%, 95%, 98%, or 99% identity thereto.

A63. The gene modifying system of embodiment A59, wherein the gene modifying polypeptide comprises an RT domain having a sequence according to SEQ ID NO: 8,113, or a sequence having at least 70%, 80%, 85%, 90%, 95%, 98%, or 99% identity thereto.

A64. The gene modifying system of embodiment A59, wherein the gene modifying polypeptide comprises DNA binding domain having a sequence of a Cas9 nickase comprising an N863A mutation, e.g., a sequence according to SEQ ID NO: 11,096, or a sequence having at least 70%, 80%, 85%, 90%, 95%, 98%, or 99% identity thereto.

A65. The gene modifying system of embodiment A59, which produces a first nick in a first strand of the human PAH gene.

A66. The gene modifying system of embodiment A65, which further comprises a second strand-targeting gRNA that directs a second nick to the second strand of the human PAH gene.

A67. The gene modifying system of embodiment A66, wherein the first nick and the second nick are 80-120 nucleotides apart.

A68. The gene modifying system of embodiment A66, wherein the template RNA and the second strand-targeting gRNA are configured to produce an outward nick orientation.

A69. The gene modifying system of embodiment A66, wherein the second strand-targeting gRNA comprises a spacer sequence that is complementary to a human PAH gene having a disease mutation or a wild-type sequence.

A70. A method for modifying a target site in the human PAH gene in a cell, the method comprising contacting the cell with the gene modifying system of embodiment 59, thereby modifying the target site in the human PAH gene in a cell.

A71. The method of embodiment A70, wherein correction of the mutation occurs in at least 30% of target nucleic acids.

A72. A method for treating a subject having a disease or condition associated with a mutation in the human PAH gene, wherein the disease or condition is phenylketonuria (PKU) or hyperphenylalaninemia (e.g., mild or severe hyperphenylalaninemia), the method comprising administering to the subject the gene modifying system of embodiment 59, thereby treating the subject having a disease or condition associated with a mutation in the human PAH gene.

BRIEF DESCRIPTION OF THE DRAWINGS

The patent or application file contains at least one drawing executed in color. Copies of this patent or patent application publication with color drawing(s) will be provided by the Office upon request and payment of the necessary fee.

FIG. 1 depicts a gene modifying system as described herein. The left hand diagram shows the gene modifying polypeptide, which comprises a Cas nickase domain (e.g., spCas9 N863A) and a reverse transcriptase domain (RT domain) which are linked by a linker. The right hand diagram shows the template RNA which comprises, from 5' to 3', a gRNA spacer, a gRNA scaffold, a heterologous object sequence, and a primer binding site sequence (PBS sequence). The heterologous object sequence can comprise a mutation region that comprises one or more sequence differences relative to the target site. The heterologous object sequence can also comprise a pre-edit homology region and a post-edit homology region, which flank the mutation region. Without wishing to be bound by theory, it is thought that the gRNA spacer of the template RNA binds to the second strand of a target site in the genome, and the gRNA

scaffold of the template RNA binds to the gene modifying polypeptide, e.g., localizing the gene modifying polypeptide to the target site in the genome. It is thought that the Cas domain of the gene modifying polypeptide nicks the target site (e.g., the first strand of the target site), e.g., allowing the PBS sequence to bind to a sequence adjacent to the site to be altered on the first strand of the target site. It is thought that the RT domain of the gene modifying polypeptide uses the first strand of the target site that is bound to the complementary sequence comprising the PBS sequence of the template RNA as a primer and the heterologous object sequence of the template RNA as a template to, e.g., polymerize a sequence complementary to the heterologous object sequence. Without wishing to be bound by theory, it is thought that reverse transcription can then proceed through the pre-edit homology region, then through the mutation region, and then through the post-edit homology region, thereby producing a DNA strand comprising a mutation specified by the heterologous object sequence.

FIG. 2 is a graph showing the percent rewriting achieved using the RNAV209-013 or RNAV214-040 gene modifying polypeptides with the indicated template RNAs.

FIG. 3 is a graph showing the amount of *Fah* mRNA relative to wild type when template RNAs are used with the RNAV209-013 or RNAV214-040 gene modifying polypeptides.

FIG.4 is a graph showing the percentage of Cas9-positive hepatocytes 6 hours following dosing with LNPs containing various gene modifying polypeptides and template RNAs.

FIG. 5 is a graph showing the rewrite levels in liver samples 6 days following dosing with LNPs containing various gene modifying polypeptides and template RNAs.

FIG. 6 is a graph showing wild type *Fah* mRNA restoration compared to littermate heterozygous mice in liver samples following dosing with LNPs containing various gene modifying polypeptides and template RNAs.

FIG. 7 is a graph showing Fah protein distribution in liver samples following dosing with LNPs containing various gene modifying polypeptides and template RNAs.

FIG. 8 is a series of western blots showing Cas9-RT Expression 6 hours after infusion of Cas9-RT mRNA + TTR guide LNP. Each lane represents an individual animal where 20 µg of tissue homogenate was added per lane. Positive control was from an *in vitro* cell experiment where Cas9-RT was expressed (described previously). GAPDH was used as a loading control for each sample. n=4 per group, vehicle or treated.

FIG. 9 is a graph showing gene editing of TTR locus after treatment with Cas9-RT mRNA + TTR guide LNP. Level of indels detected at the TTR locus measured by TIDE analysis of Sanger sequencing of the TTR locus where the protospacer targets.

FIG. 10 is a graph showing that TTR Serum levels decrease after treatment with Cas9-RT mRNA + TTR guide LNP. Measurement of circulating TTR levels 5 days after mice were treated with LNPs encapsulating Cas9-RT + TTR guide RNA.

FIG. 11 is a graph showing Cas9-RT Expression after infusion of Cas9-RT mRNA + TTR guide LNP. Relative expression quantified by ProteinSimple Jess capillary electrophoresis Western blot. Numbers in the symbols are animal number in group. Vehicle n=2, Cas9-RT + TTR guide n=3.

FIG. 12 is a graph showing gene editing of TTR locus after infusion of Cas9-RT mRNA + TTR guide LNP. Level of indels detected at the TTR locus were measured by amplicon sequencing of the TTR locus where the protospacer targets. Each animal had 8 different biopsies taken across the liver where amplicon sequencing measured the percentage of reads showing an indel.

FIG. 13 is a graph showing percent rewriting in primary mouse hepatocytes nucleofected with various gene modifying systems.

FIG. 14 is a graph showing percent editing in primary mouse hepatocytes nucleofected with various gene modifying systems containing second-nick gRNAs.

FIG. 15 is a heat map showing rewriting efficiency of various gene modifying systems with or without second-nick gRNAs.

FIG. 16 is a graph showing the percent of mouse hepatocytes expressing Cas9 six hours post-dosing with various gene modifying systems.

FIG. 17 is a pair of western blots showing expression of Cas9 in mouse liver samples six hours post-dosing with various gene modifying systems.

FIG. 18 is a graph showing the level of phenylalanine (Phe) present in plasma samples 7 days post-dosing with various gene modifying systems.

FIGs. 19A-19B are graphs showing percent rewriting (**FIG. 19A**) and percent indel (**FIG. 19B**) in mouse liver 7 days post-dosing with various gene modifying systems.

FIGs. 20A-20C are graphs showing percent rewriting in liver samples (**FIG. 20A**),levels of Phe in plasma (**FIG. 20B**), and percent indels in mouse liver (**FIG. 20C)** 7 days post-dosing with various gene modifying systems.

FIGs. 21A-21B are a pair of graphs showing percent rewriting and percent indel in liver samples (**FIG. 21A**) and levels of Phe in plasma (**FIG. 21B**) 7 days post-dosing with various gene modifying systems with or without second-nick gRNAs.

FIG. 22 is a graph showing the level of phenylalanine (Phe) in the plasma versus percent rewriting in samples obtained from mice treated with various gene modifying systems.

FIG. 23 is a graph showing percent rewriting in HEK293T cells containing the ***M fascicularis*** PAH gene for four different mutation types using template RNAs containing four different spacer sequences.

FIGs. 24A-24C are graphs showing percent rewriting (FIG. 24A) and percent indels (FIG. 24B) in mouse liver cells, or concentration of Phe in plasma (FIG. 24C) days post-dosing with LNPs comprising various gene modifying systems.

FIGs. 25A-25C are heat maps showing percent rewriting for each combination of template RNA and second strand-targeting RNA in primary human hepatocytes (**FIG. 25A**) and primary mouse hepatocytes (**FIG. 25C**) following transfection with (**FIGs. 25A** and **25B**) or LNP delivery of (**FIG. 25C**) various gene modifying systems.

FIGs. 26A-26B are graphs showing percent rewriting (FIG. 26A) and percent indels (FIG. 26B) in 7- and 28-day liver samples following LNP delivery of gene modifying systems to mice.

FIG. 27 is a graph showing the concentration of Phe in 7- and 28-day plasma samples following LNP delivery of gene modifying systems to mice.

FIG. 28 is a graph showing the concentration of Phe in 7- and 28-day brain samples following LNP delivery of gene modifying systems to mice.

FIG. 29 is a graph showing the concentration of Phe in the brain versus concentration of Phe in the plasma from samples used to generate **FIGs. 27** and **28**.

FIGs. 30A-30H are heat maps showing percent rewriting for each combination of template RNA and second strand-targeting RNA following mRNA delivery of gene modifying systems to primary cyno hepatocytes.

FIGs. 31A-31B are a graph stratified by silent substitution (**FIG. 31A**) showing percent total rewriting following mRNA delivery of various gene modifying systems utilizing the hPKU3

template RNAs comprising various silent substitutions into human iPSC-derived hepatoblasts and a chart (**FIG. 31B**) showing the particular silent substitutions utilized in **FIG. 31A**. FIG. 31B discloses SEQ ID NOS 37642-37649, respectively, in order of appearance.

FIGs. 32A-32B are a graph stratified by silent substitution (**FIG. 32A**) showing percent total rewriting following mRNA delivery of various gene modifying systems utilizing the hPKU4 template RNAs comprising various silent substitutions into human iPSC-derived hepatoblasts and a chart (**FIG. 32B**) showing the particular silent substitutions utilized in **FIG. 32A**. FIG. 32B discloses SEQ ID NOS 37650-37657, respectively, in order of appearance.

FIGs. 33A-33B are a graph (33A) and a chart (33B) showing are a graph stratified by silent substitution (**FIG. 33A**) showing percent total rewriting following mRNA delivery of various gene modifying systems utilizing the hPKU5 template RNAs comprising various silent substitutions into human iPSC-derived hepatoblasts and a chart (**FIG. 33B**) showing the particular silent substitutions utilized in **FIG. 33A**. FIG. 33B discloses SEQ ID NOS 37658-37665, respectively, in order of appearance.

FIGs. 34A-34B are a graph stratified by silent substitution (**FIG. 34A**) showing percent total rewriting following mRNA delivery of various gene modifying systems utilizing the hPKU6 template RNAs comprising various silent substitutions into human iPSC-derived hepatoblasts and a chart (**FIG. 34B**) showing the particular silent substitutions utilized in **FIG. 34A**.

FIG. 35 is a graph showing serum levels of Phe in mice following treatment with LNPs comprising various gene modifying systems.

FIGs. 36A-36B are graphs showing percent rewriting (**FIG. 36A**) and percent indels (**FIG. 36B**) in mouse liver following treatment with LNPs comprising various gene modifying systems.

DETAILED DESCRIPTION

Definitions

The term “expression cassette,” as used herein, refers to a nucleic acid construct comprising nucleic acid elements sufficient for the expression of the nucleic acid molecule of the instant invention.

A “gRNA spacer”, as used herein, refers to a portion of a nucleic acid that has complementarity to a target nucleic acid and can, together with a gRNA scaffold, target a Cas protein to the target nucleic acid.

A “gRNA scaffold”, as used herein, refers to a portion of a nucleic acid that can bind a Cas protein and can, together with a gRNA spacer, target the Cas protein to the target nucleic acid. In some embodiments, the gRNA scaffold comprises a crRNA sequence, tetraloop, and tracrRNA sequence.

A “gene modifying polypeptide”, as used herein, refers to a polypeptide comprising a retroviral reverse transcriptase, or a polypeptide comprising an amino acid sequence having at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% amino acid sequence identity to a retroviral reverse transcriptase, which is capable of integrating a nucleic acid sequence (e.g., a sequence provided on a template nucleic acid) into a target DNA molecule (e.g., in a mammalian host cell, such as a genomic DNA molecule in the host cell). In some embodiments, the gene modifying polypeptide is capable of integrating the sequence substantially without relying on host machinery. In some embodiments, the gene modifying polypeptide integrates a sequence into a random position in a genome, and in some embodiments, the gene modifying polypeptide integrates a sequence into a specific target site. In some embodiments, a gene modifying polypeptide includes one or more domains that, collectively, facilitate 1) binding the template nucleic acid, 2) binding the target DNA molecule, and 3) facilitate integration of the at least a portion of the template nucleic acid into the target DNA. Gene modifying polypeptides include both naturally occurring polypeptides as well as engineered variants of the foregoing, e.g., having one or more amino acid substitutions to the naturally occurring sequence. Gene modifying polypeptides also include heterologous constructs, e.g., where one or more of the domains recited above are heterologous to each other, whether through a heterologous fusion (or other conjugate) of otherwise wild-type domains, as well as fusions of modified domains, e.g., by way of replacement or fusion of a heterologous sub-domain or other substituted domain. Exemplary gene modifying polypeptides, and systems comprising them and methods of using them, that can be used in the methods provided herein are described, e.g., in PCT/US2021/020948, which is incorporated herein by reference with respect to gene modifying polypeptides that comprise a retroviral reverse transcriptase domain. In some embodiments, a gene modifying polypeptide integrates a sequence into a gene. In some embodiments, a gene modifying polypeptide integrates a sequence into a sequence outside of a gene. A “gene modifying system,” as used herein, refers to a system comprising a gene modifying polypeptide and a template nucleic acid.

The term “domain” as used herein refers to a structure of a biomolecule that contributes to a specified function of the biomolecule. A domain may comprise a contiguous region (e.g., a contiguous sequence) or distinct, non-contiguous regions (e.g., non-contiguous sequences) of a biomolecule. Examples of protein domains include, but are not limited to, an endonuclease domain, a DNA binding domain, a reverse transcription domain; an example of a domain of a nucleic acid is a regulatory domain, such as a transcription factor binding domain. In some embodiments, a domain (e.g., a Cas domain) can comprise two or more smaller domains (e.g., a DNA binding domain and an endonuclease domain).

As used herein, the term “exogenous”, when used with reference to a biomolecule (such as a nucleic acid sequence or polypeptide) means that the biomolecule was introduced into a host genome, cell or organism by the hand of man. For example, a nucleic acid that is as added into an existing genome, cell, tissue or subject using recombinant DNA techniques or other methods is exogenous to the existing nucleic acid sequence, cell, tissue or subject.

As used herein, “first strand” and “second strand”, as used to describe the individual DNA strands of target DNA, distinguish the two DNA strands based upon which strand the reverse transcriptase domain initiates polymerization, e.g., based upon where target primed synthesis initiates. The first strand refers to the strand of the target DNA upon which the reverse transcriptase domain initiates polymerization, e.g., where target primed synthesis initiates. The second strand refers to the other strand of the target DNA. First and second strand designations do not describe the target site DNA strands in other respects; for example, in some embodiments the first and second strands are nicked by a polypeptide described herein, but the designations ‘first’ and ‘second’ strand have no bearing on the order in which such nicks occur.

The term “heterologous,” as used herein to describe a first element in reference to a second element means that the first element and second element do not exist in nature disposed as described. For example, a heterologous polypeptide, nucleic acid molecule, construct or sequence refers to (a) a polypeptide, nucleic acid molecule or portion of a polypeptide or nucleic acid molecule sequence that is not native to a cell in which it is expressed, (b) a polypeptide or nucleic acid molecule or portion of a polypeptide or nucleic acid molecule that has been altered or mutated relative to its native state, or (c) a polypeptide or nucleic acid molecule with an altered expression as compared to the native expression levels under similar conditions. For example, a heterologous regulatory sequence (e.g., promoter, enhancer) may be used to regulate

expression of a gene or a nucleic acid molecule in a way that is different than the gene or a nucleic acid molecule is normally expressed in nature. In another example, a heterologous domain of a polypeptide or nucleic acid sequence (e.g., a DNA binding domain of a polypeptide or nucleic acid encoding a DNA binding domain of a polypeptide) may be disposed relative to other domains or may be a different sequence or from a different source, relative to other domains or portions of a polypeptide or its encoding nucleic acid. In certain embodiments, a heterologous nucleic acid molecule may exist in a native host cell genome, but may have an altered expression level or have a different sequence or both. In other embodiments, heterologous nucleic acid molecules may not be endogenous to a host cell or host genome but instead may have been introduced into a host cell by transformation (e.g., transfection, electroporation), wherein the added molecule may integrate into the host genome or can exist as extra-chromosomal genetic material either transiently (e.g., mRNA) or semi-stably for more than one generation (e.g., episomal viral vector, plasmid or other self-replicating vector).

As used herein, “insertion” of a sequence into a target site refers to the net addition of DNA sequence at the target site, e.g., where there are new nucleotides in the heterologous object sequence with no cognate positions in the unedited target site. In some embodiments, a nucleotide alignment of the PBS sequence and heterologous object sequence to the target nucleic acid sequence would result in an alignment gap in the target nucleic acid sequence.

As used herein, a “deletion” generated by a heterologous object sequence in a target site refers to the net deletion of DNA sequence at the target site, e.g., where there are nucleotides in the unedited target site with no cognate positions in the heterologous object sequence. In some embodiments, a nucleotide alignment of the PBS sequence and heterologous object sequence to the target nucleic acid sequence would result in an alignment gap in the molecule comprising the PBS sequence and heterologous object sequence.

The term “inverted terminal repeats” or “ITRs” as used herein refers to AAV viral cis-elements named so because of their symmetry. These elements promote efficient multiplication of an AAV genome. It is hypothesized that the minimal elements for ITR function are a Rep-binding site (RBS; 5´-GCGCGCTCGCTCGCTC-3´ for AAV2; SEQ ID NO: 4601) and a terminal resolution site (TRS; 5´-AGTTGG-3´ for AAV2) plus a variable palindromic sequence allowing for hairpin formation. According to the present invention, an ITR comprises at least these three elements (RBS, TRS, and sequences allowing the formation of an hairpin). In

addition, in the present invention, the term "ITR" refers to ITRs of known natural AAV serotypes (e.g. ITR of a serotype 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or 11 AAV), to chimeric ITRs formed by the fusion of ITR elements derived from different serotypes, and to functional variants thereof. "Functional variant" refers to a sequence presenting a sequence identity of at least 80%, 85%, 90%, preferably of at least 95% with a known ITR and allowing multiplication of the sequence that includes said ITR in the presence of Rep proteins.

The term "mutation region," as used herein, refers to a region in a template RNA having one or more sequence difference relative to the corresponding sequence in a target nucleic acid. The sequence difference may comprise, for example, a substitution, insertion, frameshift, or deletion.

The term "mutated" when applied to nucleic acid sequences means that nucleotides in a nucleic acid sequence are inserted, deleted, or changed compared to a reference (e.g., native) nucleic acid sequence. A single alteration may be made at a locus (a point mutation), or multiple nucleotides may be inserted, deleted, or changed at a single locus. In addition, one or more alterations may be made at any number of loci within a nucleic acid sequence. A nucleic acid sequence may be mutated by any method known in the art.

"Nucleic acid molecule" refers to both RNA and DNA molecules including, without limitation, complementary DNA ("cDNA"), genomic DNA ("gDNA"), and messenger RNA ("mRNA"), and also includes synthetic nucleic acid molecules, such as those that are chemically synthesized or recombinantly produced, such as RNA templates, as described herein. The nucleic acid molecule can be double-stranded or single-stranded, circular, or linear. If single-stranded, the nucleic acid molecule can be the sense strand or the antisense strand. Unless otherwise indicated, and as an example for all sequences described herein under the general format "SEQ ID NO:," or "nucleic acid comprising SEQ ID NO:1" refers to a nucleic acid, at least a portion which has either (i) the sequence of SEQ ID NO:1, or (ii) a sequence complimentary to SEQ ID NO:1. The choice between the two is dictated by the context in which SEQ ID NO:1 is used. For instance, if the nucleic acid is used as a probe, the choice between the two is dictated by the requirement that the probe be complementary to the desired target. Nucleic acid sequences of the present disclosure may be modified chemically or biochemically or may contain non-natural or derivatized nucleotide bases, as will be readily appreciated by those of skill in the art. Such modifications include, for example, labels, methylation,

substitution of one or more naturally occurring nucleotides with an analog, inter-nucleotide modifications such as uncharged linkages (for example, methyl phosphonates, phosphotriesters, phosphoramidates, carbamates, etc.), charged linkages (for example, phosphorothioates, phosphorodithioates, etc.), pendant moieties, (for example, polypeptides), intercalators (for example, acridine, psoralen, etc.), chelators, alkylators, and modified linkages (for example, alpha anomeric nucleic acids, etc.). Also included are chemically modified bases (see, for example, Table 13), backbones (see, for example, Table 14), and modified caps (see, for example, Table 15). Also included are synthetic molecules that mimic polynucleotides in their ability to bind to a designated sequence via hydrogen bonding and other chemical interactions. Such molecules are known in the art and include, for example, those in which peptide linkages substitute for phosphate linkages in the backbone of a molecule, e.g., peptide nucleic acids (PNAs). Other modifications can include, for example, analogs in which the ribose ring contains a bridging moiety or other structure such as modifications found in "locked" nucleic acids (LNAs). In various embodiments, the nucleic acids are in operative association with additional genetic elements, such as tissue-specific expression-control sequence(s) (e.g., tissue-specific promoters and tissue-specific microRNA recognition sequences), as well as additional elements, such as inverted repeats (e.g., inverted terminal repeats, such as elements from or derived from viruses, e.g., AAV ITRs) and tandem repeats, inverted repeats/direct repeats, homology regions (segments with various degrees of homology to a target DNA), untranslated regions (UTRs) (5′, 3′, or both 5′ and 3′ UTRs), and various combinations of the foregoing. The nucleic acid elements of the systems provided by the invention can be provided in a variety of topologies, including single-stranded, double-stranded, circular, linear, linear with open ends, linear with closed ends, and particular versions of these, such as doggybone DNA (dbDNA), closed-ended DNA (ceDNA).

As used herein, a "gene expression unit" is a nucleic acid sequence comprising at least one regulatory nucleic acid sequence operably linked to at least one effector sequence. A first nucleic acid sequence is operably linked with a second nucleic acid sequence when the first nucleic acid sequence is placed in a functional relationship with the second nucleic acid sequence. For instance, a promoter or enhancer is operably linked to a coding sequence if the promoter or enhancer affects the transcription or expression of the coding sequence. Operably

linked DNA sequences may be contiguous or non-contiguous. Where necessary to join two protein-coding regions, operably linked sequences may be in the same reading frame.

The terms "host genome" or "host cell", as used herein, refer to a cell and/or its genome into which protein and/or genetic material has been introduced. It should be understood that such terms are intended to refer not only to the particular subject cell and/or genome, but to the progeny of such a cell and/or the genome of the progeny of such a cell. Because certain modifications may occur in succeeding generations due to either mutation or environmental influences, such progeny may not, in fact, be identical to the parent cell, but are still included within the scope of the term "host cell" as used herein. A host genome or host cell may be an isolated cell or cell line grown in culture, or genomic material isolated from such a cell or cell line, or may be a host cell or host genome which composing living tissue or an organism. In some instances, a host cell may be an animal cell or a plant cell, e.g., as described herein. In certain instances, a host cell may be a mammalian cell, a human cell, avian cell, reptilian cell, bovine cell, horse cell, pig cell, goat cell, sheep cell, chicken cell, or turkey cell. In certain instances, a host cell may be a corn cell, soy cell, wheat cell, or rice cell.

As used herein, "operative association" describes a functional relationship between two nucleic acid sequences, such as a 1) promoter and 2) a heterologous object sequence, and means, in such example, the promoter and heterologous object sequence (e.g., a gene of interest) are oriented such that, under suitable conditions, the promoter drives expression of the heterologous object sequence. For instance, a template nucleic acid carrying a promoter and a heterologous object sequence may be single-stranded, e.g., either the (+) or (-) orientation. An "operative association" between the promoter and the heterologous object sequence in this template means that, regardless of whether the template nucleic acid will be transcribed in a particular state, when it is in the suitable state (e.g., is in the (+) orientation, in the presence of required catalytic factors, and NTPs, etc.), it is accurately transcribed. Operative association applies analogously to other pairs of nucleic acids, including other tissue-specific expression control sequences (such as enhancers, repressors and microRNA recognition sequences), IR/DR, ITRs, UTRs, or homology regions and heterologous object sequences or sequences encoding a retroviral RT domain.

The term "primer binding site sequence" or "PBS sequence," as used herein, refers to a portion of a template RNA capable of binding to a region comprised in a target nucleic acid

sequence. In some instances, a PBS sequence is a nucleic acid sequence comprising at least 3, 4, 5, 6, 7, or 8 bases with 100% identity to the region comprised in the target nucleic acid sequence. In some embodiments the primer region comprises at least 5, 6, 7, 8 bases with 100% identity to the region comprised in the target nucleic acid sequence. Without wishing to be bound by theory, in some embodiments when a template RNA comprises a PBS sequence and a heterologous object sequence, the PBS sequence binds to a region comprised in a target nucleic acid sequence, allowing a reverse transcriptase domain to use that region as a primer for reverse transcription, and to use the heterologous object sequence as a template for reverse transcription.

As used herein, a "stem-loop sequence" refers to a nucleic acid sequence (e.g., RNA sequence) with sufficient self-complementarity to form a stem-loop, e.g., having a stem comprising at least two (e.g., 3, 4, 5, 6, 7, 8, 9, or 10) base pairs, and a loop with at least three (e.g., four) base pairs. The stem may comprise mismatches or bulges.

As used herein, a "tissue-specific expression-control sequence" means nucleic acid elements that increase or decrease the level of a transcript comprising the heterologous object sequence in a target tissue in a tissue-specific manner, e.g., preferentially in on-target tissue(s), relative to off-target tissue(s). In some embodiments, a tissue-specific expression-control sequence preferentially drives or represses transcription, activity, or the half-life of a transcript comprising the heterologous object sequence in the target tissue in a tissue-specific manner, e.g., preferentially in an on-target tissue(s), relative to an off-target tissue(s). Exemplary tissue-specific expression-control sequences include tissue-specific promoters, repressors, enhancers, or combinations thereof, as well as tissue-specific microRNA recognition sequences. Tissue specificity refers to on-target (tissue(s) where expression or activity of the template nucleic acid is desired or tolerable) and off-target (tissue(s) where expression or activity of the template nucleic acid is not desired or is not tolerable). For example, a tissue-specific promoter drives expression preferentially in on-target tissues, relative to off-target tissues. In contrast, a microRNA that binds the tissue-specific microRNA recognition sequences is preferentially expressed in off-target tissues, relative to on-target tissues, thereby reducing expression of a template nucleic acid in off-target tissues. Accordingly, a promoter and a microRNA recognition sequence that are specific for the same tissue, such as the target tissue, have contrasting functions (promote and repress, respectively, with concordant expression levels, i.e., high levels of the microRNA in off-target tissues and low levels in on-target tissues, while promoters drive high

expression in on-target tissues and low expression in off-target tissues) with regard to the transcription, activity, or half-life of an associated sequence in that tissue.

Introduction

This disclosure relates to methods for treating phenylketonuria (PKU) and compositions for targeting, editing, modifying or manipulating a DNA sequence (e.g., inserting a heterologous object sequence into a target site of a mammalian genome) at one or more locations in a DNA sequence in a cell, tissue or subject, e.g., *in vivo* or *in vitro*. The heterologous object DNA sequence may include, e.g., a substitution.

More specifically, the disclosure provides methods for treating PKU using reverse transcriptase-based systems for altering a genomic DNA sequence of interest, e.g., by inserting, deleting, or substituting one or more nucleotides into/from the sequence of interest.

The disclosure provides, in part, methods for treating PKU using a gene modifying system comprising a gene modifying polypeptide component and a template nucleic acid (e.g., template RNA) component. In some embodiments, a gene modifying system can be used to introduce an alteration into a target site in a genome. In some embodiments, the gene modifying polypeptide component comprises a writing domain (e.g., a reverse transcriptase domain), a DNA-binding domain, and an endonuclease domain (e.g., nickase domain). In some embodiments, the template nucleic acid (e.g., template RNA) comprises a sequence (e.g., a gRNA spacer) that binds a target site in the genome (e.g., that binds to a second strand of the target site), a sequence (e.g., a gRNA scaffold) that binds the gene modifying polypeptide component, a heterologous object sequence, and a PBS sequence. Without wishing to be bound by theory, it is thought that the template nucleic acid (e.g., template RNA) binds to the second strand of a target site in the genome, and binds to the gene modifying polypeptide component (e.g., localizing the polypeptide component to the target site in the genome). It is thought that the endonuclease (e.g., nickase) of the gene modifying polypeptide component cuts the target site (e.g., the first strand of the target site), e.g., allowing the PBS sequence to bind to a sequence adjacent to the site to be altered on the first strand of the target site. It is thought that the writing domain (e.g., reverse transcriptase domain) of the polypeptide component uses the first strand of

the target site that is bound to the complementary sequence comprising the PBS sequence of the template nucleic acid as a primer and the heterologous object sequence of the template nucleic acid as a template to, e.g., polymerize a sequence complementary to the heterologous object sequence. Without wishing to be bound by theory, it is thought that selection of an appropriate heterologous object sequence can result in substitution, deletion, and/or insertion of one or more nucleotides at the target site.

Gene modifying systems

In some embodiments, a gene modifying system described herein comprises: (A) a gene modifying polypeptide or a nucleic acid encoding the gene modifying polypeptide, wherein the gene modifying polypeptide comprises (i) a reverse transcriptase domain, and either (x) an endonuclease domain that contains DNA binding functionality or (y) an endonuclease domain and separate DNA binding domain; and (B) a template RNA. A gene modifying polypeptide, in some embodiments, acts as a substantially autonomous protein machine capable of integrating a template nucleic acid sequence into a target DNA molecule (e.g., in a mammalian host cell, such as a genomic DNA molecule in the host cell), substantially without relying on host machinery. For example, the gene modifying protein may comprise a DNA-binding domain, a reverse transcriptase domain, and an endonuclease domain. In some embodiments, the DNA-binding function may involve an RNA component that directs the protein to a DNA sequence, e.g., a gRNA spacer. In other embodiments, the gene modifying polypeptide may comprise a reverse transcriptase domain and an endonuclease domain. The RNA template element of a gene modifying system is typically heterologous to the gene modifying polypeptide element and provides an object sequence to be inserted (reverse transcribed) into the host genome. In some embodiments, the gene modifying polypeptide is capable of target primed reverse transcription. In some embodiments, the gene modifying polypeptide is capable of second-strand synthesis.

In some embodiments the gene modifying system is combined with a second polypeptide. In some embodiments, the second polypeptide may comprise an endonuclease domain. In some embodiments, the second polypeptide may comprise a polymerase domain, e.g., a reverse transcriptase domain. In some embodiments, the second polypeptide may comprise a DNA-dependent DNA polymerase domain. In some embodiments, the second polypeptide aids in

completion of the genome edit, e.g., by contributing to second-strand synthesis or DNA repair resolution.

A functional gene modifying polypeptide can be made up of unrelated DNA binding, reverse transcription, and endonuclease domains. This modular structure allows combining of functional domains, e.g., dCas9 (DNA binding), MMLV reverse transcriptase (reverse transcription), FokI (endonuclease). In some embodiments, multiple functional domains may arise from a single protein, e.g., Cas9 or Cas9 nickase (DNA binding, endonuclease).

In some embodiments, a gene modifying polypeptide includes one or more domains that, collectively, facilitate 1) binding the template nucleic acid, 2) binding the target DNA molecule, and 3) facilitate integration of the at least a portion of the template nucleic acid into the target DNA. In some embodiments, the gene modifying polypeptide is an engineered polypeptide that comprises one or more amino acid substitutions to a corresponding naturally occurring sequence. In some embodiments, the gene modifying polypeptide comprises two or more domains that are heterologous relative to each other, e.g., through a heterologous fusion (or other conjugate) of otherwise wild-type domains, or well as fusions of modified domains, e.g., by way of replacement or fusion of a heterologous sub-domain or other substituted domain. For instance, in some embodiments, one or more of: the RT domain is heterologous to the DBD; the DBD is heterologous to the endonuclease domain; or the RT domain is heterologous to the endonuclease domain.

In some embodiments, a template RNA molecule for use in the system comprises, from 5′ to 3′ (1) a gRNA spacer; (2) a gRNA scaffold; (3) heterologous object sequence (4) a primer binding site (PBS) sequence. In some embodiments:

(1) Is a gRNA spacer of ~18-22 nt, e.g., is 20 nt

(2) Is a gRNA scaffold comprising one or more hairpin loops, e.g., 1, 2, of 3 loops for associating the template with a Cas domain, e.g., a nickase Cas9 domain. In some embodiments, the gRNA scaffold comprises the sequence, from 5′ to 3′, GTTTTAGAGCTAGAAATAGCAAGTTAAAATAAGGCTAGTCCGTTATCAACTTGAAAAAGTGGGACCGAGTCGGTCC (SEQ ID NO: 5008).

(3) In some embodiments, the heterologous object sequence is, e.g., 7-74, e.g., 10-20, 20-30, 30-40, 40-50, 50-60, 60-70, or 70-80 nt or, 80-90 nt in length. In some embodiments, the first (most 5′) base of the sequence is not C.

(4) In some embodiments, the PBS sequence that binds the target priming sequence after nicking occurs is e.g., 3-20 nt, e.g., 7-15 nt, e.g., 12-14 nt. In some embodiments, the PBS sequence has 40-60% GC content.

In some embodiments, a second gRNA associated with the system may help drive complete integration. In some embodiments, the second gRNA may target a location that is 0-200 nt away from the first-strand nick, e.g., 0-50, 50-100, 100-200 nt away from the first-strand nick. In some embodiments, the second gRNA can only bind its target sequence after the edit is made, e.g., the gRNA binds a sequence present in the heterologous object sequence, but not in the initial target sequence.

In some embodiments, a gene modifying system described herein is used to make an edit in HEK293, K562, U2OS, or HeLa cells. In some embodiment, a gene modifying system is used to make an edit in primary cells, e.g., primary cortical neurons from E18.5 mice.

In some embodiments, a gene modifying polypeptide as described herein comprises a reverse transcriptase or RT domain (e.g., as described herein) that comprises a MoMLV RT sequence or variant thereof. In embodiments, the MoMLV RT sequence comprises one or more mutations selected from D200N, L603W, T330P, T306K, W313F, D524G, E562Q, D583N, P51L, S67R, E67K, T197A, H204R, E302K, F309N, L435G, N454K, H594Q, D653N, R110S, and K103L. In embodiments, the MoMLV RT sequence comprises a combination of mutations, such as D200N, L603W, and T330P, optionally further including T306K and/or W313F.

In some embodiments, an endonuclease domain (e.g., as described herein) nCas9, e.g., comprising an N863A mutation (e.g., in spCas9) or a H840A mutation.

In some embodiments, the heterologous object sequence (e.g., of a system as described herein) is about 1-50, 50-100, 100-200, 200-300, 300-400, 400-500, 500-600, 600-700, 700-800, 800-900, 900-1000, or more, nucleotides in length.

In some embodiments, the RT and endonuclease domains are joined by a flexible linker, e.g., comprising the amino acid sequence SGGSSGGSSGSETPGTSESATPESSGGSSGGSS (SEQ ID NO: 5006).

In some embodiments, the endonuclease domain is N-terminal relative to the RT domain. In some embodiments, the endonuclease domain is C-terminal relative to the RT domain.

In some embodiments, the system incorporates a heterologous object sequence into a target site by TPRT, e.g., as described herein.

In some embodiments, a gene modifying polypeptide comprises a DNA binding domain. In some embodiments, a gene modifying polypeptide comprises an RNA binding domain. In some embodiments, the RNA binding domain comprises an RNA binding domain of B-box protein, MS2 coat protein, dCas, or an element of a sequence of a table herein. In some embodiments, the RNA binding domain is capable of binding to a template RNA with greater affinity than a reference RNA binding domain.

In some embodiments, a gene modifying system is capable of producing an insertion into the target site of at least 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, or 100 nucleotides (and optionally no more than 500, 400, 300, 200, or 100 nucleotides). In some embodiments, a gene modifying system is capable of producing an insertion into the target site of at least 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, or 100 nucleotides (and optionally no more than 500, 400, 300, 200, or 100 nucleotides). In some embodiments, a gene modifying system is capable of producing an insertion into the target site of at least 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6, 6.5, 7, 7.5, 8, 8.5, 9, 9.5 or 10 kilobases (and optionally no more than 1, 5, 10, or 20 kilobases). In some embodiments, a gene modifying system is capable of producing a deletion of at least 81, 85, 90, 95, 100, 110, 120, 130, 140, 150, 160, 170, 180, 190, or 200 nucleotides (and optionally no more than 500, 400, 300, or 200 nucleotides). In some embodiments, a gene modifying system is capable of producing a deletion of at least 81, 85, 90, 95, 100, 110, 120, 130, 140, 150, 160, 170, 180, 190, or 200 nucleotides (and optionally no more than 500, 400, 300, or 200 nucleotides). In some embodiments, a gene modifying system is capable of producing a deletion of at least 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 110, 120, 130, 140, 150, 160, 170, 180, 190, or 200 nucleotides (and optionally no more than 500, 400, 300, or 200 nucleotides). In some embodiments, a gene modifying system is capable of producing a deletion of at least 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6, 6.5, 7, 7.5, 8, 8.5, 9, 9.5 or 10 kilobases (and optionally no more than 1, 5, 10, or 20 kilobases). In some embodiments, a gene modifying system is capable of producing a substitution into the target site of at least 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, or 100 or more

nucleotides. In some embodiments, a gene modifying system is capable of producing a substitution in the target site of 1-2, 2-3, 3-4, 4-5, 5-10, 10-15, 15-20, 20-30, 30-40, 40-50, 50-60, 60-70, 70-80, 80-90, or 90-100 nucleotides.

In some embodiments, the substitution is a transition mutation. In some embodiments, the substitution is a transversion mutation. In some embodiments, the substitution converts an adenine to a thymine, an adenine to a guanine, an adenine to a cytosine, a guanine to a thymine, a guanine to a cytosine, a guanine to an adenine, a thymine to a cytosine, a thymine to an adenine, a thymine to a guanine, a cytosine to an adenine, a cytosine to a guanine, or a cytosine to a thymine.

In some embodiments, an insertion, deletion, substitution, or combination thereof, increases or decreases expression (e.g. transcription or translation) of a gene. In some embodiments, an insertion, deletion, substitution, or combination thereof, increases or decreases expression (e.g. transcription or translation) of a gene by altering, adding, or deleting sequences in a promoter or enhancer, e.g. sequences that bind transcription factors. In some embodiments, an insertion, deletion, substitution, or combination thereof alters translation of a gene (e.g. alters an amino acid sequence), inserts or deletes a start or stop codon, alters or fixes the translation frame of a gene. In some embodiments, an insertion, deletion, substitution, or combination thereof alters splicing of a gene, e.g. by inserting, deleting, or altering a splice acceptor or donor site. In some embodiments, an insertion, deletion, substitution, or combination thereof alters transcript or protein half-life. In some embodiments, an insertion, deletion, substitution, or combination thereof alters protein localization in the cell (e.g. from the cytoplasm to a mitochondria, from the cytoplasm into the extracellular space (e.g. adds a secretion tag)). In some embodiments, an insertion, deletion, substitution, or combination thereof alters (e.g. improves) protein folding (e.g. to prevent accumulation of misfolded proteins). In some embodiments, an insertion, deletion, substitution, or combination thereof, alters, increases, decreases the activity of a gene, e.g. a protein encoded by the gene.

Exemplary gene modifying polypeptides, and systems comprising them and methods of using them are described, e.g., in PCT/US2021/020948, which is incorporated herein by reference with respect to retroviral RT domains, including the amino acid and nucleic acid sequences therein.

Exemplary gene modifying polypeptides and retroviral RT domain sequences are also described, e.g., in International Application No. PCT/US21/20948 filed March 4, 2021, e.g., at Table 30, Table 31, and Table 44 therein; the entire application is incorporated by reference herein with respect to retroviral RTs, e.g., in said sequences and tables. Accordingly, a gene modifying polypeptide described herein may comprise an amino acid sequence according to any of the Tables mentioned in this paragraph, or a domain thereof (e.g., a retroviral RT domain), or a functional fragment or variant of any of the foregoing, or an amino acid sequence having at least 70%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In some embodiments, a polypeptide for use in any of the systems described herein can be a molecular reconstruction or ancestral reconstruction based upon the aligned polypeptide sequence of multiple homologous proteins. In some embodiments, a reverse transcriptase domain for use in any of the systems described herein can be a molecular reconstruction or an ancestral reconstruction, or can be modified at particular residues, based upon alignments of reverse transcriptase domains from the same or different sources. A skilled artisan can, based on the Accession numbers provided herein, align polypeptides or nucleic acid sequences, e.g., by using routine sequence analysis tools as Basic Local Alignment Search Tool (BLAST) or CD-Search for conserved domain analysis. Molecular reconstructions can be created based upon sequence consensus, e.g. using approaches described in Ivics et al., Cell 1997, 501 – 510 ; Wagstaff et al., Molecular Biology and Evolution 2013, 88-99.

Polypeptide components of gene modifying systems

In some embodiments, the gene modifying polypeptide possesses the functions of DNA target site binding, template nucleic acid (e.g., RNA) binding, DNA target site cleavage, and template nucleic acid (e.g., RNA) writing, e.g., reverse transcription. In some embodiments, each functions is contained within a distinct domain. In some embodiments, a function may be attributed to two or more domains (e.g., two or more domains, together, exhibit the functionality). In some embodiments, two or more domains may have the same or similar function (e.g., two or more domains each independently have DNA-binding functionality, e.g., for two different DNA sequences). In other embodiments, one or more domains may be capable of enabling one or more functions, e.g., a Cas9 domain enabling both DNA binding and target site cleavage. In some embodiments, the domains are all located within a single polypeptide. In

some embodiments, a first domain is in one polypeptide and a second domain is in a second polypeptide. For example, in some embodiments, the sequences may be split between a first polypeptide and a second polypeptide, e.g., wherein the first polypeptide comprises a reverse transcriptase (RT) domain and wherein the second polypeptide comprises a DNA-binding domain and an endonuclease domain, e.g., a nickase domain. As a further example, in some embodiments, the first polypeptide and the second polypeptide each comprise a DNA binding domain (e.g., a first DNA binding domain and a second DNA binding domain). In some embodiments, the first and second polypeptide may be brought together post-translationally via a split-intein to form a single gene modifying polypeptide.

In some aspects, a gene modifying polypeptide described herein comprises (e.g., a system described herein comprises a gene modifying polypeptide that comprises): 1) a Cas domain (e.g., a Cas nickase domain, e.g., a Cas9 nickase domain); 2) a reverse transcriptase (RT) domain of Table D, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 97%, 98%, or 99% identity thereto, wherein the RT domain is C-terminal of the Cas domain; and a linker disposed between the RT domain and the Cas domain, wherein the linker has a sequence from the same row of Table D as the RT domain, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 97%, 98%, or 99% identity thereto.

In some embodiments, the RT domain has a sequence with 100% identity to the RT domain of Table D and the linker has a sequence with 100% identity to the linker sequence from the same row of Table D as the RT domain. In some embodiments, the Cas domain comprises a sequence of Table 8, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 98%, or 99% identity thereto. In some embodiments, the gene modifying polypeptide comprises an amino acid sequence according to any of SEQ ID NOs: 1-3332 in the sequence listing, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 97%, 98%, or 99% identity thereto.

In some embodiments, the gene modifying polypeptide comprises a GG amino acid sequence between the Cas domain and the linker, an AG amino acid sequence between the RT domain and the second NLS, and/or a GG amino acid sequence between the linker and the RT domain. In some embodiments, the gene modifying polypeptide comprises a sequence of SEQ ID NO: 4000 which comprises the first NLS and the Cas domain, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 98%, or 99% identity thereto. In some embodiments, the gene modifying polypeptide comprises a sequence of SEQ ID NO: 4001 which comprises the

second NLS, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 98%, or 99% identity thereto.

<u>Writing domain (RT Domain)</u>

In certain aspects of the present invention, the writing domain of the gene modifying system possesses reverse transcriptase activity and is also referred to as a reverse transcriptase domain (a RT domain). In some embodiments, the RT domain comprises an RT catalytic portion and RNA-binding region (e.g., a region that binds the template RNA).

In some embodiments, a nucleic acid encoding the reverse transcriptase is altered from its natural sequence to have altered codon usage, e.g. improved for human cells. In some

embodiments the reverse transcriptase domain is a heterologous reverse transcriptase from a retrovirus. In some embodiments, the RT domain comprising a gene modifying polypeptide has been mutated from its original amino acid sequence, e.g., has at least 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 20, 30, 40, 50, 60, 70, 80, 90, or 100 substitutions. In some embodiments, the RT domain is derived from the RT of a retrovirus, e.g., HIV-1 RT, Moloney Murine Leukemia Virus (MMLV) RT, avian myeloblastosis virus (AMV) RT, or Rous Sarcoma Virus (RSV) RT.

In some embodiments, the retroviral reverse transcriptase (RT) domain exhibits enhanced stringency of target-primed reverse transcription (TPRT) initiation, e.g., relative to an endogenous RT domain. In some embodiments, the RT domain initiates TPRT when the 3 nt in the target site immediately upstream of the first strand nick, e.g., the genomic DNA priming the RNA template, have at least 66% or 100% complementarity to the 3 nt of homology in the RNA template. In some embodiments, the RT domain initiates TPRT when there are less than 5 nt mismatched (e.g., less than 1, 2, 3, 4, or 5 nt mismatched) between the template RNA homology and the target DNA priming reverse transcription. In some embodiments, the RT domain is modified such that the stringency for mismatches in priming the TPRT reaction is increased, e.g., wherein the RT domain does not tolerate any mismatches or tolerates fewer mismatches in the priming region relative to a wild-type (e.g., unmodified) RT domain. In some embodiments, the RT domain comprises a HIV-1 RT domain. In embodiments, the HIV-1 RT domain initiates lower levels of synthesis even with three nucleotide mismatches relative to an alternative RT domain (e.g., as described by Jamburuthugoda and Eickbush J Mol Biol 407(5):661-672 (2011); incorporated herein by reference in its entirety). In some embodiments, the RT domain forms a dimer (e.g., a heterodimer or homodimer). In some embodiments, the RT domain is monomeric. In some embodiments, an RT domain, naturally functions as a monomer or as a dimer (e.g., heterodimer or homodimer). In some embodiments, an RT domain naturally functions as a monomer, e.g., is derived from a virus wherein it functions as a monomer. In embodiments, the RT domain is selected from an RT domain from murine leukemia virus (MLV; sometimes referred to as MoMLV) (e.g., P03355), porcine endogenous retrovirus (PERV) (e.g., UniProt Q4VFZ2), mouse mammary tumor virus (MMTV) (e.g., UniProt P03365), Avian reticuloendotheliosis virus (AVIRE) (e.g., UniProtKB accession: P03360); Feline leukemia virus (FLV or FeLV) (e.g., e.g., UniProtKB accession: P10273); Mason-Pfizer monkey virus (MPMV) (e.g., UniProt P07572), bovine leukemia virus (BLV) (e.g., UniProt P03361), human T-cell

leukemia virus-1 (HTLV-1) (e.g., UniProt P03362), human foamy virus (HFV) (e.g., UniProt P14350), simian foamy virus (SFV) (e.g., SFV3L) (e.g., UniProt P23074 or P27401), or bovine foamy/syncytial virus (BFV/BSV) (e.g., UniProt O41894), or a functional fragment or variant thereof (e.g., an amino acid sequence having at least 70%, 80%, 90%, 95%, or 99% identity thereto). In some embodiments, an RT domain is dimeric in its natural functioning. In some embodiments, the RT domain is derived from a virus wherein it functions as a dimer. In embodiments, the RT domain is selected from an RT domain from avian sarcoma/leukemia virus (ASLV) (e.g., UniProt A0A142BKH1), Rous sarcoma virus (RSV) (e.g., UniProt P03354), avian myeloblastosis virus (AMV) (e.g., UniProt Q83133), human immunodeficiency virus type I (HIV-1) (e.g., UniProt P03369), human immunodeficiency virus type II (HIV-2) (e.g., UniProt P15833), simian immunodeficiency virus (SIV) (e.g., UniProt P05896), bovine immunodeficiency virus (BIV) (e.g., UniProt P19560), equine infectious anemia virus (EIAV) (e.g., UniProt P03371), or feline immunodeficiency virus (FIV) (e.g., UniProt P16088) (Herschhorn and Hizi *Cell Mol Life Sci* 67(16):2717-2747 (2010)), or a functional fragment or variant thereof (e.g., an amino acid sequence having at least 70%, 80%, 90%, 95%, or 99% identity thereto). Naturally heterodimeric RT domains may, in some embodiments, also be functional as homodimers. In some embodiments, dimeric RT domains are expressed as fusion proteins, e.g., as homodimeric fusion proteins or heterodimeric fusion proteins. In some embodiments, the RT function of the system is fulfilled by multiple RT domains (e.g., as described herein). In further embodiments, the multiple RT domains are fused or separate, e.g., may be on the same polypeptide or on different polypeptides.

In some embodiments, a gene modifying system described herein comprises an integrase domain, e.g., wherein the integrase domain may be part of the RT domain. In some embodiments, an RT domain (e.g., as described herein) comprises an integrase domain. In some embodiments, an RT domain (e.g., as described herein) lacks an integrase domain, or comprises an integrase domain that has been inactivated by mutation or deleted. In some embodiment, a gene modifying system described herein comprises an RNase H domain, e.g., wherein the RNase H domain may be part of the RT domain. In some embodiments, the RNase H domain is not part of the RT domain and is covalently linked via a flexible linker. In some embodiments, an RT domain (e.g., as described herein) comprises an RNase H domain, e.g., an endogenous RNAse H domain or a heterologous RNase H domain. In some embodiments, an RT domain (e.g., as

described herein) lacks an RNase H domain. In some embodiments, an RT domain (e.g., as described herein) comprises an RNase H domain that has been added, deleted, mutated, or swapped for a heterologous RNase H domain. In some embodiments, the polypeptide comprises an inactivated endogenous RNase H domain. In some embodiments, an endogenous RNase H domain from one of the other domains of the polypeptide is genetically removed such that it is not included in the polypeptide, e.g., the endogenous RNase H domain is partially or completely truncated from the comprising domain. In some embodiments, mutation of an RNase H domain yields a polypeptide exhibiting lower RNase activity, e.g., as determined by the methods described in Kotewicz et al. *Nucleic Acids Res* 16(1):265-277 (1988) (incorporated herein by reference in its entirety), e.g., lower by at least 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, or 90% compared to an otherwise similar domain without the mutation. In some embodiments, RNase H activity is abolished.

In some embodiments, an RT domain is mutated to increase fidelity compared to an otherwise similar domain without the mutation. For instance, in some embodiments, a YADD (SEQ ID NO: 37635) or YMDD motif (SEQ ID NO: 37636) in an RT domain (e.g., in a reverse transcriptase) is replaced with YVDD (SEQ ID NO: 37637). In embodiments, replacement of the YADD (SEQ ID NO: 37635) or YMDD (SEQ ID NO: 37636) or YVDD (SEQ ID NO: 37637) results in higher fidelity in retroviral reverse transcriptase activity (e.g., as described in Jamburuthugoda and Eickbush J Mol Biol 2011; incorporated herein by reference in its entirety).

In some embodiments, a gene modifying polypeptide described herein comprises an RT domain having an amino acid sequence according to Table 6, or a sequence having at least 70%, 80%, 85%, 90%, 95%, 97%, 98%, or 99% identity thereto. In some embodiments, a nucleic acid described herein encodes an RT domain having an amino acid sequence according to Table 6, or a sequence having at least 70%, 80%, 85%, 90%, 95%, 97%, 98%, or 99% identity thereto.

In some embodiments, reverse transcriptase domains are modified, for example by site-specific mutation. In some embodiments, reverse transcriptase domains are engineered to have improved properties, e.g. SuperScript IV (SSIV) reverse transcriptase derived from the MMLV RT. In some embodiments, the reverse transcriptase domain may be engineered to have lower error rates, e.g., as described in WO2001068895, incorporated herein by reference. In some embodiments, the reverse transcriptase domain may be engineered to be more thermostable. In some embodiments, the reverse transcriptase domain may be engineered to be more processive. In some embodiments, the reverse transcriptase domain may be engineered to have tolerance to inhibitors. In some embodiments, the reverse transcriptase domain may be engineered to be faster. In some embodiments, the reverse transcriptase domain may be engineered to better tolerate modified nucleotides in the RNA template. In some embodiments, the reverse transcriptase domain may be engineered to insert modified DNA nucleotides. In some embodiments, the reverse transcriptase domain is engineered to bind a template RNA. In some embodiments, one or more mutations are chosen from D200N, L603W, T330P, D524G, E562Q, D583N, P51L, S67R, E67K, T197A, H204R, E302K, F309N, W313F, L435G, N454K, H594Q, L671P, E69K, H8Y, T306K, or D653N in the RT domain of murine leukemia virus reverse transcriptase or a corresponding mutation at a corresponding position of another RT domain.

In some embodiments, a gene modifying polypeptide comprises the RT domain from a retroviral reverse transcriptase, e.g., a wild-type M-MLV RT, e.g., comprising the following sequence:

M-MLV (WT):

Core RT (bold), annotated per above
RNAseH (underlined), annotated per above

In embodiments, the gene modifying polypeptide further comprises one additional amino acid at the C-terminus of the sequence of amino acids 659-1329 of NP_057933. In embodiments, the gene modifying polypeptide comprises an RNaseH1 domain (e.g., amino acids 1178-1318 of NP_057933).

In some embodiments, a retroviral reverse transcriptase domain, e.g., M-MLV RT, may comprise one or more mutations from a wild-type sequence that may improve features of the RT, e.g., thermostability, processivity, and/or template binding. In some embodiments, an M-MLV RT domain comprises, relative to the M-MLV (WT) sequence above, one or more mutations, e.g., selected from D200N, L603W, T330P, T306K, W313F, D524G, E562Q, D583N, P51L, S67R, E67K, T197A, H204R, E302K, F309N, L435G, N454K, H594Q, D653N, R110S, K103L, e.g., a combination of mutations, such as D200N, L603W, and T330P, optionally further including T306K and W313F. In some embodiments, an M-MLV RT used herein comprises the mutations D200N, L603W, T330P, T306K and W313F. In embodiments, the mutant M-MLV RT comprises the following amino acid sequence:

M-MLV (PE2):

TLNIEDEYRLHETSKEPDVSLGSTWLSDFPQAWAETGGMGLAVRQAPLIIPLKATSTPVSI

GNRMADQAARKAAITETPDTSTLLI (SEQ ID NO: 5005)

In some embodiments, a writing domain (e.g., RT domain) comprises an RNA-binding domain, e.g., that specifically binds to an RNA sequence. In some embodiments, a template RNA comprises an RNA sequence that is specifically bound by the RNA-binding domain of the writing domain.

In some embodiments, the reverse transcription domain only recognizes and reverse transcribes a specific template, e.g., a template RNA of the system. In some embodiments, the template comprises a sequence or structure that enables recognition and reverse transcription by a reverse transcription domain. In some embodiments, the template comprises a sequence or structure that enables association with an RNA-binding domain of a polypeptide component of a genome engineering system described herein. In some embodiments, the genome engineering system reverse preferably transcribes a template comprising an association sequence over a template lacking an association sequence.

The writing domain may also comprise DNA-dependent DNA polymerase activity, e.g., comprise enzymatic activity capable of writing DNA into the genome from a template DNA sequence. In some embodiments, DNA-dependent DNA polymerization is employed to complete second-strand synthesis of a target site edit. In some embodiments, the DNA-dependent DNA polymerase activity is provided by a DNA polymerase domain in the polypeptide. In some embodiments, the DNA-dependent DNA polymerase activity is provided by a reverse transcriptase domain that is also capable of DNA-dependent DNA polymerization, e.g., second-strand synthesis. In some embodiments, the DNA-dependent DNA polymerase activity is provided by a second polypeptide of the system. In some embodiments, the DNA-

dependent DNA polymerase activity is provided by an endogenous host cell polymerase that is optionally recruited to the target site by a component of the genome engineering system.

In some embodiments, the reverse transcriptase domain has a lower probability of premature termination rate (P_{off}) *in vitro* relative to a reference reverse transcriptase domain. In some embodiments, the reference reverse transcriptase domain is a viral reverse transcriptase domain, e.g., the RT domain from M-MLV.

In some embodiments, the reverse transcriptase domain has a lower probability of premature termination rate (P_{off}) *in vitro* of less than about 5×10^{-3}/nt, 5×10^{-4}/nt, or 5×10^{-6}/nt, e.g., as measured on a 1094 nt RNA. In embodiments, the *in vitro* premature termination rate is determined as described in Bibillo and Eickbush (2002) J Biol Chem 277(38):34836-34845 (incorporated by reference herein its entirety).

In some embodiments, the reverse transcriptase domain is able to complete at least about 30% or 50% of integrations in cells. The percent of complete integrations can be measured by dividing the number of substantially full-length integration events (e.g., genomic sites that comprise at least 98% of the expected integrated sequence) by the number of total (including substantially full-length and partial) integration events in a population of cells. In embodiments, the integrations in cells is determined (e.g., across the integration site) using long-read amplicon sequencing, e.g., as described in Karst et al. (2020) *bioRxiv* doi.org/10.1101/645903 (incorporated by reference herein in its entirety).

In embodiments, quantifying integrations in cells comprises counting the fraction of integrations that contain at least about 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, 99%, or 100% of the DNA sequence corresponding to the template RNA (e.g., a template RNA having a length of at least 0.05, 0.1, 0.5, 0.6, 0.7, 0.8, 0.9, 1, 1.5, 2, 3, 4, or 5 kb, e.g., a length between 0.5-0.6, 0.6-0.7, 0.7-0.8, 0.8-0.9, 1.0-1.2, 1.2-1.4, 1.4-1.6, 1.6-1.8, 1.8-2.0, 2-3, 3-4, or 4-5 kb).

In some embodiments, the reverse transcriptase domain is capable of polymerizing dNTPs *in vitro*. In embodiments, the reverse transcriptase domain is capable of polymerizing dNTPs *in vitro* at a rate between 0.1 – 50 nt/sec (e.g., between 0.1-1, 1-10, or 10-50 nt/sec). In embodiments, polymerization of dNTPs by the reverse transcriptase domain is measured by a single-molecule assay, e.g., as described in Schwartz and Quake (2009) *PNAS* 106(48):20294-20299 (incorporated by reference in its entirety).

In some embodiments, the reverse transcriptase domain has an *in vitro* error rate (e.g., misincorporation of nucleotides) of between $1 \times 10^{-3} – 1 \times 10^{-4}$ or $1 \times 10^{-4} – 1 \times 10^{-5}$ substitutions/nt , e.g., as described in Yasukawa et al. (2017) *Biochem Biophys Res Commun* 492(2):147-153 (incorporated herein by reference in its entirety). In some embodiments, the reverse transcriptase domain has an error rate (e.g., misincorporation of nucleotides) in cells (e.g., HEK293T cells) of between $1 \times 10^{-3} – 1 \times 10^{-4}$ or $1 \times 10^{-4} – 1 \times 10^{-5}$ substitutions/nt, e.g., by long-read amplicon sequencing, e.g., as described in Karst et al. (2020) *bioRxiv* doi.org/10.1101/645903 (incorporated by reference herein in its entirety).

In some embodiments, the reverse transcriptase domain is capable of performing reverse transcription of a target RNA *in vitro*. In some embodiments, the reverse transcriptase requires a primer of at least 3 nucleotides to initiate reverse transcription of a template. In some embodiments, reverse transcription of the target RNA is determined by detection of cDNA from the target RNA (e.g., when provided with a ssDNA primer, e.g., which anneals to the target with at least 3, 4, 5, 6, 7, 8, 9, or 10 nt at the 3´ end), e.g., as described in Bibillo and Eickbush (2002) *J Biol Chem* 277(38):34836-34845 (incorporated herein by reference in its entirety).

In some embodiments, the reverse transcriptase domain performs reverse transcription at least 5 or 10 times more efficiently (e.g., by cDNA production), e.g., when converting its RNA template to cDNA, for example, as compared to an RNA template lacking the protein binding motif (e.g., a 3´ UTR). In embodiments, efficiency of reverse transcription is measured as described in Yasukawa et al. (2017) *Biochem Biophys Res Commun* 492(2):147-153 (incorporated by reference herein in its entirety).

In some embodiments, the reverse transcriptase domain specifically binds a specific RNA template with higher frequency (e.g., about 5 or 10-fold higher frequency) than any endogenous cellular RNA, e.g., when expressed in cells (e.g., HEK293T cells). In embodiments, frequency of specific binding between the reverse transcriptase domain and the template RNA are measured by CLIP-seq, e.g., as described in Lin and Miles (2019) *Nucleic Acids Res* 47(11):5490-5501 (incorporated herein by reference in its entirety).

In some embodiments, an RT domain (e.g., as listed in Table 6) comprises one or more mutations as listed in Table 2 below. In some embodiment, an RT domain as listed in Table 6 comprises one, two, three, four, five, or six of the mutations listed in the corresponding row of Table 2 below.

Template nucleic acid binding domain

The gene modifying polypeptide typically contains regions capable of associating with the template nucleic acid (e.g., template RNA). In some embodiments, the template nucleic acid binding domain is an RNA binding domain. In some embodiments, the RNA binding domain is a modular domain that can associate with RNA molecules containing specific signatures, e.g., structural motifs. In other embodiments, the template nucleic acid binding domain (e.g., RNA binding domain) is contained within the reverse transcription domain, e.g., the reverse transcriptase-derived component has a known signature for RNA preference.

In other embodiments, the template nucleic acid binding domain (e.g., RNA binding domain) is contained within the target DNA binding domain. For example, in some embodiments, the DNA binding domain is a CRISPR-associated protein that recognizes the

structure of a template nucleic acid (e.g., template RNA) comprising a gRNA. In some embodiments, a gene modifying polypeptide comprises a DNA-binding domain comprising a CRISPR-associated protein that associates with a gRNA scaffold that allows the DNA-binding domain to bind a target genomic DNA sequence. In some embodiments, the gRNA scaffold and gRNA spacer is comprised within the template nucleic acid (e.g., template RNA), thus the DNA-binding domain is also the template nucleic acid binding domain. In some embodiments, the polypeptide possesses RNA binding function in multiple domains, e.g., can bind a gRNA structure in a CRISPR-associated DNA binding domain and an additional sequence or structure in a reverse transcriptase domain.

In some embodiments, the RNA binding domain is capable of binding to a template RNA with greater affinity than a reference RNA binding domain. In some embodiments, the reference RNA binding domain is an RNA binding domain from Cas9 of S. pyogenes. In some embodiments, the RNA binding domain is capable of binding to a template RNA with an affinity between 100 pM – 10 nM (e.g., between 100 pM-1 nM or 1 nM – 10 nM). In some embodiments, the affinity of a RNA binding domain for its template RNA is measured *in vitro,* e.g., by thermophoresis, e.g., as described in Asmari et al. Methods 146:107-119 (2018) (incorporated by reference herein in its entirety). In some embodiments, the affinity of a RNA binding domain for its template RNA is measured in cells (e.g., by FRET or CLIP-Seq).

In some embodiments, the RNA binding domain is associated with the template RNA *in vitro* at a frequency at least about 5-fold or 10-fold higher than with a scrambled RNA. In some embodiments, the frequency of association between the RNA binding domain and the template RNA or scrambled RNA is measured by CLIP-seq, e.g., as described in Lin and Miles (2019) *Nucleic Acids Res* 47(11):5490-5501 (incorporated by reference herein in its entirety). In some embodiments, the RNA binding domain is associated with the template RNA in cells (e.g., in HEK293T cells) at a frequency at least about 5-fold or 10-fold higher than with a scrambled RNA. In some embodiments, the frequency of association between the RNA binding domain and the template RNA or scrambled RNA is measured by CLIP-seq, e.g., as described in Lin and Miles (2019), *supra.*

Endonuclease domains and DNA binding domains

In some embodiments, a gene modifying polypeptide possesses the function of DNA target site cleavage via an endonuclease domain. In some embodiments, a gene modifying polypeptide comprises a DNA binding domain, e.g., for binding to a target nucleic acid. In some embodiments, a domain (e.g., a Cas domain) of the gene modifying polypeptide comprises two or more smaller domains, e.g., a DNA binding domain and an endonuclease domain. It is understood that when a DNA binding domain (e.g., a Cas domain) is said to bind to a target nucleic acid sequence, in some embodiments, the binding is mediated by a gRNA.

In some embodiments, a domain has two functions. For example, in some embodiments, the endonuclease domain is also a DNA-binding domain. In some embodiments, the endonuclease domain is also a template nucleic acid (e.g., template RNA) binding domain. For example, in some embodiments, a polypeptide comprises a CRISPR-associated endonuclease domain that binds a template RNA comprising a gRNA, binds a target DNA sequence (e.g., with complementarity to a portion of the gRNA), and cuts the target DNA sequence. In some embodiments, an endonuclease domain or endonuclease/DNA-binding domain from a heterologous source can be used or can be modified (e.g., by insertion, deletion, or substitution of one or more residues) in a gene modifying system described herein.

In some embodiments, a nucleic acid encoding the endonuclease domain or endonuclease/DNA binding domain is altered from its natural sequence to have altered codon usage, e.g. improved for human cells. In some embodiments, the endonuclease element is a heterologous endonuclease element, such as a Cas endonuclease (e.g., Cas9), a type-II restriction endonuclease (e.g., Fok1), a meganuclease (e.g., I-SceI), or other endonuclease domain.

In certain aspects, the DNA-binding domain of a gene modifying polypeptide described herein is selected, designed, or constructed for binding to a desired host DNA target sequence. In certain embodiments, the DNA-binding domain of the polypeptide is a heterologous DNA-binding element. In some embodiments the heterologous DNA binding element is a zinc-finger element or a TAL effector element, e.g., a zinc-finger or TAL polypeptide or functional fragment thereof. In some embodiments the heterologous DNA binding element is a sequence-guided DNA binding element, such as Cas9, Cpf1, or other CRISPR-related protein that has been altered to have no endonuclease activity. In some embodiments the heterologous DNA binding element retains endonuclease activity. In some embodiments, the heterologous DNA binding element retains partial endonuclease activity to cleave ssDNA, e.g., possesses nickase activity. In

specific embodiments, the heterologous DNA-binding domain can be any one or more of Cas9, TAL domain, ZF domain, Myb domain, combinations thereof, or multiples thereof.

In some embodiments, DNA-binding domains are modified, for example by site-specific mutation, increasing or decreasing DNA-binding elements (for example, number and/or specificity of zinc fingers), etc., to alter DNA-binding specificity and affinity. In some embodiments a nucleic acid sequence encoding the DNA binding domain is altered from its natural sequence to have altered codon usage, e.g. improved for human cells. In embodiments, the DNA binding domain comprises one or more modifications relative to a wild-type DNA binding domain, e.g., a modification via directed evolution, e.g., phage-assisted continuous evolution (PACE).

In some embodiments, the DNA binding domain comprises a meganuclease domain (e.g., as described herein, e.g., in the endonuclease domain section), or a functional fragment thereof. In some embodiments, the meganuclease domain possesses endonuclease activity, e.g., double-strand cleavage and/or nickase activity. In other embodiments, the meganuclease domain has reduced activity, e.g., lacks endonuclease activity, e.g., the meganuclease is catalytically inactive. In some embodiments, a catalytically inactive meganuclease is used as a DNA binding domain, e.g., as described in Fonfara et al. Nucleic Acids Res 40(2):847-860 (2012), incorporated herein by reference in its entirety.

In some embodiments, a gene modifying polypeptide comprises a modification to a DNA-binding domain, e.g., relative to the wild-type polypeptide. In some embodiments, the DNA-binding domain comprises an addition, deletion, replacement, or modification to the amino acid sequence of the original DNA-binding domain. In some embodiments, the DNA-binding domain is modified to include a heterologous functional domain that binds specifically to a target nucleic acid (e.g., DNA) sequence of interest. In some embodiments, the functional domain replaces at least a portion (e.g., the entirety of) the prior DNA-binding domain of the polypeptide. In some embodiments, the functional domain comprises a zinc finger (e.g., a zinc finger that specifically binds to the target nucleic acid (e.g., DNA) sequence of interest. In some embodiments, the functional domain comprises a Cas domain (e.g., a Cas domain that specifically binds to the target nucleic acid (e.g., DNA) sequence of interest. In some embodiments, the Cas domain comprises a Cas9 or a mutant or variant thereof (e.g., as described herein). In embodiments, the Cas domain is associated with a guide RNA (gRNA), e.g., as

described herein. In embodiments, the Cas domain is directed to a target nucleic acid (e.g., DNA) sequence of interest by the gRNA. In embodiments, the Cas domain is encoded in the same nucleic acid (e.g., RNA) molecule as the gRNA. In embodiments, the Cas domain is encoded in a different nucleic acid (e.g., RNA) molecule from the gRNA.

In some embodiments, the DNA binding domain is capable of binding to a target sequence (e.g., a dsDNA target sequence) with greater affinity than a reference DNA binding domain. In some embodiments, the reference DNA binding domain is a DNA binding domain from Cas9 of S. pyogenes. In some embodiments, the DNA binding domain is capable of binding to a target sequence (e.g., a dsDNA target sequence) with an affinity between 100 pM – 10 nM (e.g., between 100 pM-1 nM or 1 nM – 10 nM).

In some embodiments, the affinity of a DNA binding domain for its target sequence (e.g., dsDNA target sequence) is measured in vitro, e.g., by thermophoresis, e.g., as described in Asmari et al. Methods 146:107-119 (2018) (incorporated by reference herein in its entirety).

In embodiments, the DNA binding domain is capable of binding to its target sequence (e.g., dsDNA target sequence), e.g, with an affinity between 100 pM – 10 nM (e.g., between 100 pM-1 nM or 1 nM – 10 nM) in the presence of a molar excess of scrambled sequence competitor dsDNA, e.g., of about 100-fold molar excess.

In some embodiments, the DNA binding domain is found associated with its target sequence (e.g., dsDNA target sequence) more frequently than any other sequence in the genome of a target cell, e.g., human target cell, e.g., as measured by ChIP-seq (e.g., in HEK293T cells), e.g., as described in He and Pu (2010) *Curr. Protoc Mol Biol* Chapter 21 (incorporated herein by reference in its entirety). In some embodiments, the DNA binding domain is found associated with its target sequence (e.g., dsDNA target sequence) at least about 5-fold or 10-fold, more frequently than any other sequence in the genome of a target cell, e.g., as measured by ChIP-seq (e.g., in HEK293T cells), e.g., as described in He and Pu (2010), *supra*.

In some embodiments, the endonuclease domain has nickase activity and cleaves one strand of a target DNA. In some embodiments, nickase activity reduces the formation of double-stranded breaks at the target site. In some embodiments, the endonuclease domain creates a staggered nick structure in the first and second strands of a target DNA. In some embodiments, a staggered nick structure generates free 3’ overhangs at the target site. In some embodiments,

free 3’ overhangs at the target site improve editing efficiency, e.g., by enhancing access and annealing of a 3’ homology region of a template nucleic acid. In some embodiments, a staggered nick structure reduces the formation of double-stranded breaks at the target site.

In some embodiments, the endonuclease domain cleaves both strands of a target DNA, e.g., results in blunt-end cleavage of a target with no ssDNA overhangs on either side of the cut-site. The amino acid sequence of an endonuclease domain of a gene modifying system described herein may be at least about 50%, at least about 60%, at least about 70%, at least about 80%, at least about 85%, at least about 90%, at least about 95%, at least about 96%, at least about 97%, at least about 98%, at least about 99% identical to the amino acid sequence of an endonuclease domain described herein, e.g., an endonuclease domain from Table 8.

In certain embodiments, the heterologous endonuclease is Fok1 or a functional fragment thereof. In certain embodiments, the heterologous endonuclease is a Holliday junction resolvase or homolog thereof, such as the Holliday junction resolving enzyme from Sulfolobus solfataricus—Ssol Hje (Govindaraju et al., *Nucleic Acids Research* 44:7, 2016). In certain embodiments, the heterologous endonuclease is the endonuclease of the large fragment of a spliceosomal protein, such as Prp8 (Mahbub et al., *Mobile DNA* 8:16, 2017). In certain embodiments, the heterologous endonuclease is derived from a CRISPR-associated protein, e.g., Cas9. In certain embodiments, the heterologous endonuclease is engineered to have only ssDNA cleavage activity, e.g., only nickase activity, e.g., be a Cas9 nickase, e.g., SpCas9 with D10A, H840A, or N863A mutations. Table 8 provides exemplary Cas proteins and mutations associated with nickase activity. In still other embodiments, homologous endonuclease domains are modified, for example by site-specific mutation, to alter DNA endonuclease activity. In still other embodiments, endonuclease domains are modified to reduce DNA-sequence specificity, e.g., by truncation to remove domains that confer DNA-sequence specificity or mutation to inactivate regions conferring DNA-sequence specificity.

In some embodiments, the endonuclease domain has nickase activity and does not form double-stranded breaks. In some embodiments, the endonuclease domain forms single-stranded breaks at a higher frequency than double-stranded breaks, e.g., at least 90%, 95%, 96%, 97%, 98%, or 99% of the breaks are single-stranded breaks, or less than 10%, 5%, 4%, 3%, 2%, or 1% of the breaks are double-stranded breaks. In some embodiments, the endonuclease forms

substantially no double-stranded breaks. In some embodiments, the endonuclease does not form detectable levels of double-stranded breaks.

In some embodiments, the endonuclease domain has nickase activity that nicks the target site DNA of the first strand; e.g., in some embodiments, the endonuclease domain cuts the genomic DNA of the target site near to the site of alteration on the strand that will be extended by the writing domain. In some embodiments, the endonuclease domain has nickase activity that nicks the target site DNA of the first strand and does not nick the target site DNA of the second strand. For example, when a polypeptide comprises a CRISPR-associated endonuclease domain having nickase activity, in some embodiments, said CRISPR-associated endonuclease domain nicks the target site DNA strand containing the PAM site (e.g., and does not nick the target site DNA strand that does not contain the PAM site). As a further example, when a polypeptide comprises a CRISPR-associated endonuclease domain having nickase activity, in some embodiments, said CRISPR-associated endonuclease domain nicks the target site DNA strand not containing the PAM site (e.g., and does not nick the target site DNA strand that contains the PAM site).

In some other embodiments, the endonuclease domain has nickase activity that nicks the target site DNA of the first strand and the second strand. Without wishing to be bound by theory, after a writing domain (e.g., RT domain) of a polypeptide described herein polymerizes (e.g., reverse transcribes) from the heterologous object sequence of a template nucleic acid (e.g., template RNA), the cellular DNA repair machinery must repair the nick on the first DNA strand. The target site DNA now contains two different sequences for the first DNA strand: one corresponding to the original genomic DNA (e.g., having a free 5′ end) and a second corresponding to that polymerized from the heterologous object sequence (e.g., having a free 3′ end). It is thought that the two different sequences equilibrate with one another, first one hybridizing the second strand, then the other, and which sequence the cellular DNA repair apparatus incorporates into its repaired target site may be a stochastic process. Without wishing to be bound by theory, it is thought that introducing an additional nick to the second-strand may bias the cellular DNA repair machinery to adopt the heterologous object sequence-based sequence more frequently than the original genomic sequence (Anzalone et al. Nature 576:149-157 (2019)). In some embodiments, the additional nick is positioned at least 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 105, 110, 115, 120, 125, 130, 135, 140,

145, or 150 nucleotides 5′ or 3′ of the target site modification (e.g., the insertion, deletion, or substitution) or to the nick on the first strand.

Alternatively or additionally, without wishing to be bound by theory, it is thought that an additional nick to the second strand may promote second-strand synthesis. In some embodiments, where the gene modifying system has inserted or substituted a portion of the first strand, synthesis of a new sequence corresponding to the insertion/substitution in the second strand is necessary.

In some embodiments, the polypeptide comprises a single domain having endonuclease activity (e.g., a single endonuclease domain) and said domain nicks both the first strand and the second strand. For example, in such an embodiment the endonuclease domain may be a CRISPR-associated endonuclease domain, and the template nucleic acid (e.g., template RNA) comprises a gRNA spacer that directs nicking of the first strand and an additional gRNA spacer that directs nicking of the second strand. In some embodiments, the polypeptide comprises a plurality of domains having endonuclease activity, and a first endonuclease domain nicks the first strand and a second endonuclease domain nicks the second strand (optionally, the first endonuclease domain does not (e.g., cannot) nick the second strand and the second endonuclease domain does not (e.g., cannot) nick the first strand).

In some embodiments, the endonuclease domain is capable of nicking a first strand and a second strand. In some embodiments, the first and second strand nicks occur at the same position in the target site but on opposite strands. In some embodiments, the second strand nick occurs in a staggered location, e.g., upstream or downstream, from the first nick. In some embodiments, the endonuclease domain generates a target site deletion if the second strand nick is upstream of the first strand nick. In some embodiments, the endonuclease domain generates a target site duplication if the second strand nick is downstream of the first strand nick. In some embodiments, the endonuclease domain generates no duplication and/or deletion if the first and second strand nicks occur in the same position of the target site. In some embodiments, the endonuclease domain has altered activity depending on protein conformation or RNA-binding status, e.g., which promotes the nicking of the first or second strand (e.g., as described in Christensen et al. PNAS 2006; incorporated by reference herein in its entirety).

In some embodiments, the endonuclease domain comprises a meganuclease, or a functional fragment thereof. In some embodiments, the endonuclease domain comprises a

homing endonuclease, or a functional fragment thereof. In some embodiments, the endonuclease domain comprises a meganuclease from the LAGLIDADG (SEQ ID NO: 37638), GIY-YIG, HNH, His-Cys Box, or PD-(D/E) XK families, or a functional fragment or variant thereof, e.g., which possess conserved amino acid motifs, e.g., as indicated in the family names. In some embodiments, the endonuclease domain comprises a meganuclease, or fragment thereof, chosen from, e.g., I-SmaMI (Uniprot F7WD42), I-SceI (Uniprot P03882), I-AniI (Uniprot P03880), I-DmoI (Uniprot P21505), I-CreI (Uniprot P05725), I-TevI (Uniprot P13299), I-OnuI (Uniprot Q4VWW5), or I-BmoI (Uniprot Q9ANR6). In some embodiments, the meganuclease is naturally monomeric, e.g., I-SceI, I-TevI, or dimeric, e.g., I-CreI, in its functional form. For example, the LAGLIDADG meganucleases (SEQ ID NO: 37638) with a single copy of the LAGLIDADG motif (SEQ ID NO: 37638) generally form homodimers, whereas members with two copies of the LAGLIDADG motif (SEQ ID NO: 37638) are generally found as monomers. In some embodiments, a meganuclease that normally forms as a dimer is expressed as a fusion, e.g., the two subunits are expressed as a single ORF and, optionally, connected by a linker, e.g., an I-CreI dimer fusion (Rodriguez-Fornes et al. Gene Therapy 2020; incorporated by reference herein in its entirety). In some embodiments, a meganuclease, or a functional fragment thereof, is altered to favor nickase activity for one strand of a double-stranded DNA molecule, e.g., I-SceI (K122I and/or K223I) (Niu et al. J Mol Biol 2008), I-AniI (K227M) (McConnell Smith et al. PNAS 2009), I-DmoI (Q42A and/or K120M) (Molina et al. J Biol Chem 2015). In some embodiments, a meganuclease or functional fragment thereof possessing this preference for single-strand cleavage is used as an endonuclease domain, e.g., with nickase activity. In some embodiments, an endonuclease domain comprises a meganuclease, or a functional fragment thereof, which naturally targets or is engineered to target a safe harbor site, e.g., an I-CreI targeting SH6 site (Rodriguez-Fornes et al., *supra*). In some embodiments, an endonuclease domain comprises a meganuclease, or a functional fragment thereof, with a sequence tolerant catalytic domain, e.g., I-TevI recognizing the minimal motif CNNNG (Kleinstiver et al. PNAS 2012). In some embodiments, a target sequence tolerant catalytic domain is fused to a DNA binding domain, e.g., to direct activity, e.g., by fusing I-TevI to: (i) zinc fingers to create Tev-ZFEs (Kleinstiver et al. PNAS 2012), (ii) other meganucleases to create MegaTevs (Wolfs et al. Nucleic Acids Res 2014), and/or (iii) Cas9 to create TevCas9 (Wolfs et al. PNAS 2016).

In some embodiments, the endonuclease domain comprises a restriction enzyme, e.g., a Type IIS or Type IIP restriction enzyme. In some embodiments, the endonuclease domain comprises a Type IIS restriction enzyme, e.g., FokI, or a fragment or variant thereof. In some embodiments, the endonuclease domain comprises a Type IIP restriction enzyme, e.g., PvuII, or a fragment or variant thereof. In some embodiments, a dimeric restriction enzyme is expressed as a fusion such that it functions as a single chain, e.g., a FokI dimer fusion (Minczuk et al. Nucleic Acids Res 36(12):3926-3938 (2008)).

The use of additional endonuclease domains is described, for example, in Guha and Edgell Int J Mol Sci 18(22):2565 (2017), which is incorporated herein by reference in its entirety.

In some embodiments, a gene modifying polypeptide comprises a modification to an endonuclease domain, e.g., relative to a wild-type Cas protein. In some embodiments, the endonuclease domain comprises an addition, deletion, replacement, or modification to the amino acid sequence of the wild-type Cas protein. In some embodiments, the endonuclease domain is modified to include a heterologous functional domain that binds specifically to and/or induces endonuclease cleavage of a target nucleic acid (e.g., DNA) sequence of interest. In some embodiments, the endonuclease domain comprises a zinc finger. In embodiments, the endonuclease domain comprising the Cas domain is associated with a guide RNA (gRNA), e.g., as described herein. In some embodiments, the endonuclease domain is modified to include a functional domain that does not target a specific target nucleic acid (e.g., DNA) sequence. In embodiments, the endonuclease domain comprises a Fok1 domain.

In some embodiments, the endonuclease domain is associated with the target dsDNA *in vitro* at a frequency at least about 5-fold or 10-fold higher than with a scrambled dsDNA. In some embodiments, the endonuclease domain is associated with the target dsDNA *in vitro* at a frequency at least about 5-fold or 10-fold higher than with a scrambled dsDNA, e.g., in a cell (e.g., a HEK293T cell). In some embodiments, the frequency of association between the endonuclease domain and the target DNA or scrambled DNA is measured by ChIP-seq, e.g., as described in He and Pu (2010) *Curr. Protoc Mol Biol* Chapter 21 (incorporated by reference herein in its entirety).

In some embodiments, the endonuclease domain can catalyze the formation of a nick at a target sequence, e.g., to an increase of at least about 5-fold or 10-fold relative to a non-target

sequence (e.g., relative to any other genomic sequence in the genome of the target cell). In some embodiments, the level of nick formation is determined using NickSeq, e.g., as described in Elacqua et al. (2019) *bioRxiv* doi.org/10.1101/867937 (incorporated herein by reference in its entirety).

In some embodiments, the endonuclease domain is capable of nicking DNA *in vitro*. In embodiments, the nick results in an exposed base. In embodiments, the exposed base can be detected using a nuclease sensitivity assay, e.g., as described in Chaudhry and Weinfeld (1995) *Nucleic Acids Res* 23(19):3805-3809 (incorporated by reference herein in its entirety). In embodiments, the level of exposed bases (e.g., detected by the nuclease sensitivity assay) is increased by at least 10%, 50%, or more relative to a reference endonuclease domain. In some embodiments, the reference endonuclease domain is an endonuclease domain from Cas9 of S. pyogenes.

In some embodiments, the endonuclease domain is capable of nicking DNA in a cell. In embodiments, the endonuclease domain is capable of nicking DNA in a HEK293T cell. In embodiments, an unrepaired nick that undergoes replication in the absence of Rad51 results in increased NHEJ rates at the site of the nick, which can be detected, e.g., by using a Rad51 inhibition assay, e.g., as described in Bothmer et al. (2017) *Nat Commun* 8:13905 (incorporated by reference herein in its entirety). In embodiments, NHEJ rates are increased above 0-5%. In embodiments, NHEJ rates are increased to 20-70% (e.g., between 30%-60% or 40-50%), e.g., upon Rad51 inhibition.

In some embodiments, the endonuclease domain releases the target after cleavage. In some embodiments, release of the target is indicated indirectly by assessing for multiple turnovers by the enzyme, e.g., as described in Yourik at al. RNA 25(1):35-44 (2019) (incorporated herein by reference in its entirety) and shown in FIG. 2. In some embodiments, the k_{exp} of an endonuclease domain is $1 \times 10^{-3} - 1 \times 10^{-}5$ min-1 as measured by such methods.

In some embodiments, the endonuclease domain has a catalytic efficiency (k_{cat}/K_m) greater than about 1×10^8 s^{-1} M^{-1} *in vitro*. In embodiments, the endonuclease domain has a catalytic efficiency greater than about 1×10^5, 1×10^6, 1×10^7, or 1×10^8, s^{-1} M^{-1} *in vitro*. In embodiments, catalytic efficiency is determined as described in Chen et al. (2018) *Science* 360(6387):436-439 (incorporated herein by reference in its entirety). In some embodiments, the endonuclease domain has a catalytic efficiency (k_{cat}/K_m) greater than about 1×10^8 s^{-1} M^{-1} in

cells. In embodiments, the endonuclease domain has a catalytic efficiency greater than about 1 x 10^5, 1 x 10^6, 1 x 10^7, or 1 x 10^8 s^{-1} M^{-1} in cells.

Gene modifying polypeptides comprising Cas domains

In some embodiments, a gene modifying polypeptide described herein comprises a Cas domain. In some embodiments, the Cas domain can direct the gene modifying polypeptide to a target site specified by a gRNA spacer, thereby modifying a target nucleic acid sequence in "cis". In some embodiments, a gene modifying polypeptide is fused to a Cas domain. In some embodiments, a gene modifying polypeptide comprises a CRISPR/Cas domain (also referred to herein as a CRISPR-associated protein). In some embodiments, a CRISPR/Cas domain comprises a protein involved in the clustered regulatory interspaced short palindromic repeat (CRISPR) system, e.g., a Cas protein, and optionally binds a guide RNA, e.g., single guide RNA (sgRNA).

CRISPR systems are adaptive defense systems originally discovered in bacteria and archaea. CRISPR systems use RNA-guided nucleases termed CRISPR-associated or "Cas" endonucleases (e. g., Cas9 or Cpf1) to cleave foreign DNA. For example, in a typical CRISPR-Cas system, an endonuclease is directed to a target nucleotide sequence (e. g., a site in the genome that is to be sequence-edited) by sequence-specific, non-coding "guide RNAs" that target single- or double-stranded DNA sequences. Three classes (I-III) of CRISPR systems have been identified. The class II CRISPR systems use a single Cas endonuclease (rather than multiple Cas proteins). One class II CRISPR system includes a type II Cas endonuclease such as Cas9, a CRISPR RNA ("crRNA"), and a trans-activating crRNA ("tracrRNA"). The crRNA contains a "spacer" sequence, a typically about 20-nucleotide RNA sequence that corresponds to a target DNA sequence ("protospacer"). In the wild-type system, and in some engineered systems, crRNA also contains a region that binds to the tracrRNA to form a partially double-stranded structure that is cleaved by RNase III, resulting in a crRNA/tracrRNA hybrid molecule. A crRNA/tracrRNA hybrid then directs the Cas endonuclease to recognize and cleave a target DNA sequence. A target DNA sequence is generally adjacent to a "protospacer adjacent motif" ("PAM") that is specific for a given Cas endonuclease and required for cleavage activity at a target site matching the spacer of the crRNA. CRISPR endonucleases identified from various prokaryotic species have unique PAM sequence requirements, e.g., as listed for exemplary Cas enzymes in Table 7; examples of PAM sequences include 5´-NGG (Streptococcus pyogenes), 5´-

NNAGAA (Streptococcus thermophilus CRISPR1), 5´-NGGNG (Streptococcus thermophilus CRISPR3), and 5´-NNNGATT (Neisseria meningiditis). Some endonucleases, e.g., Cas9 endonucleases, are associated with G-rich PAM sites, e. g., 5´-NGG), and perform blunt-end cleaving of the target DNA at a location 3 nucleotides upstream from (5´ from) the PAM site. Another class II CRISPR system includes the type V endonuclease Cpf1, which is smaller than Cas9; examples include AsCpf1 (from Acidaminococcus sp.) and LbCpf1 (from Lachnospiraceae sp.). Cpf1-associated CRISPR arrays are processed into mature crRNAs without the requirement of a tracrRNA; in other words, a Cpf1 system, in some embodiments, comprises only Cpf1 nuclease and a crRNA to cleave a target DNA sequence. Cpf1 endonucleases, are typically associated with T-rich PAM sites, e. g., 5´-TTN. Cpf1 can also recognize a 5´-CTA PAM motif. Cpf1 typically cleaves a target DNA by introducing an offset or staggered double-strand break with a 4- or 5-nucleotide 5´ overhang, for example, cleaving a target DNA with a 5-nucleotide offset or staggered cut located 18 nucleotides downstream from (3´ from) from a PAM site on the coding strand and 23 nucleotides downstream from the PAM site on the complimentary strand; the 5-nucleotide overhang that results from such offset cleavage allows more precise genome editing by DNA insertion by homologous recombination than by insertion at blunt-end cleaved DNA. See, e.g., Zetsche et al. (2015) Cell, 163:759 – 771.

A variety of CRISPR associated (Cas) genes or proteins can be used in the technologies provided by the present disclosure and the choice of Cas protein will depend upon the particular conditions of the method. Specific examples of Cas proteins include class II systems including Cas1, Cas2, Cas3, Cas4, Cas5, Cas6, Cas7, Cas8, Cas9, Cas10, Cpf1, C2C1, or C2C3. In some embodiments, a Cas protein, e.g., a Cas9 protein, may be from any of a variety of prokaryotic species. In some embodiments a particular Cas protein, e.g., a particular Cas9 protein, is selected to recognize a particular protospacer-adjacent motif (PAM) sequence. In some embodiments, a DNA-binding domain or endonuclease domain includes a sequence targeting polypeptide, such as a Cas protein, e.g., Cas9. In certain embodiments a Cas protein, e.g., a Cas9 protein, may be obtained from a bacteria or archaea or synthesized using known methods. In certain embodiments, a Cas protein may be from a gram-positive bacteria or a gram-negative bacteria. In certain embodiments, a Cas protein may be from a Streptococcus (e.g., a S. pyogenes, or a S. thermophilus), a Francisella (e.g., an F. novicida), a Staphylococcus (e.g., an S. aureus), an Acidaminococcus (e.g., an Acidaminococcus sp. BV3L6), a Neisseria (e.g., an N. meningitidis),

a Cryptococcus, a Corynebacterium, a Haemophilus, a Eubacterium, a Pasteurella, a Prevotella, a Veillonella, or a Marinobacter.

In some embodiments, a gene modifying polypeptide may comprise the amino acid sequence of SEQ ID NO: 4000 below, or a sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, 99% identity thereto. In embodiments, the amino acid sequence of SEQ ID NO: 4000 below, or the sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, 99% identity thereto, is positioned at the N-terminal end of the gene modifying polypeptide. In embodiments, the amino acid sequence of SEQ ID NO: 4000 below, or the sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, 99% identity thereto, is positioned within 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, or 30 amino acids of the N-terminal end of the gene modifying polypeptide.

In some embodiments, a Cas protein requires a protospacer adjacent motif (PAM) to be present in or adjacent to a target DNA sequence for the Cas protein to bind and/or function. In some embodiments, the PAM is or comprises, from 5′ to 3′, NGG, YG, NNGRRT, NNNRRT,

NGA, TYCV, TATV, NTTN, or NNNGATT, where N stands for any nucleotide, Y stands for C or T, R stands for A or G, and V stands for A or C or G.In some embodiments, a Cas protein is a protein listed in Table 7 or 8. In some embodiments, a Cas protein comprises one or more mutations altering its PAM. In some embodiments, a Cas protein comprises E1369R, E1449H, and R1556A mutations or analogous substitutions to the amino acids corresponding to said positions. In some embodiments, a Cas protein comprises E782K, N968K, and R1015H mutations or analogous substitutions to the amino acids corresponding to said positions. In some embodiments, a Cas protein comprises D1135V, R1335Q, and T1337R mutations or analogous substitutions to the amino acids corresponding to said positions. In some embodiments, a Cas protein comprises S542R and K607R mutations or analogous substitutions to the amino acids corresponding to said positions. In some embodiments, a Cas protein comprises S542R, K548V, and N552R mutations or analogous substitutions to the amino acids corresponding to said positions. Exemplary advances in the engineering of Cas enzymes to recognize altered PAM sequences are reviewed in Collias et al Nature Communications 12:555 (2021), incorporated herein by reference in its entirety.

In some embodiments, the Cas protein is catalytically active and cuts one or both strands of the target DNA site. In some embodiments, cutting the target DNA site is followed by formation of an alteration, e.g., an insertion or deletion, e.g., by the cellular repair machinery.

In some embodiments, the Cas protein is modified to deactivate or partially deactivate the nuclease, e.g., nuclease-deficient Cas9. Whereas wild-type Cas9 generates double-strand breaks (DSBs) at specific DNA sequences targeted by a gRNA, a number of CRISPR endonucleases having modified functionalities are available, for example: a “nickase” version of Cas9 that has been partially deactivated generates only a single-strand break; a catalytically inactive Cas9 (“dCas9”) does not cut target DNA. In some embodiments, dCas9 binding to a DNA sequence may interfere with transcription at that site by steric hindrance. In some embodiments, dCas9 binding to an anchor sequence may interfere with (e.g., decrease or prevent) genomic complex (e.g., ASMC) formation and/or maintenance. In some embodiments, a DNA-binding domain comprises a catalytically inactive Cas9, e.g., dCas9. Many catalytically inactive Cas9 proteins are known in the art. In some embodiments, dCas9 comprises mutations in each endonuclease domain of the Cas protein, e.g., D10A and H840A or N863A mutations. In some embodiments, a catalytically inactive or partially inactive CRISPR/Cas domain comprises a Cas protein

comprising one or more mutations, e.g., one or more of the mutations listed in Table 7. In some embodiments, a Cas protein described on a given row of Table 7 comprises one, two, three, or all of the mutations listed in the same row of Table 7. In some embodiments, a Cas protein, e.g., not described in Table 7, comprises one, two, three, or all of the mutations listed in a row of Table 7 or a corresponding mutation at a corresponding site in that Cas protein.

In some embodiments, a catalytically inactive, e.g., dCas9, or partially deactivated Cas9 protein comprises a D11 mutation (e.g., D11A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a H969 mutation (e.g., H969A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a N995 mutation (e.g., N995A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, comprises mutations at one, two, or three of positions D11, H969, and N995 (e.g., D11A, H969A, and N995A mutations) or analogous substitutions to the amino acids corresponding to said positions.

In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a D10 mutation (e.g., a D10A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a H557 mutation (e.g., a H557A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, comprises a D10 mutation (e.g., a D10A mutation) and a H557 mutation (e.g., a H557A mutation) or analogous substitutions to the amino acids corresponding to said positions.

In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a D839 mutation (e.g., a D839A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a H840 mutation (e.g., a H840A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a N863 mutation (e.g., a N863A

mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, comprises a D10 mutation (e.g., D10A), a D839 mutation (e.g., D839A), a H840 mutation (e.g., H840A), and a N863 mutation (e.g., N863A) or analogous substitutions to the amino acids corresponding to said positions.

In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a E993 mutation (e.g., a E993A mutation) or an analogous substitution to the amino acid corresponding to said position.

In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a D917 mutation (e.g., a D917A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a a E1006 mutation (e.g., a E1006A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a D1255 mutation (e.g., a D1255A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, comprises a D917 mutation (e.g., D917A), a E1006 mutation (e.g., E1006A), and a D1255 mutation (e.g., D1255A) or analogous substitutions to the amino acids corresponding to said positions.

In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a D16 mutation (e.g., a D16A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a D587 mutation (e.g., a D587A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a partially deactivated Cas domain has nickase activity. In some embodiments, a partially deactivated Cas9 domain is a Cas9 nickase domain. In some embodiments, the catalytically inactive Cas domain or dead Cas domain produces no detectable double strand break formation. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a H588 mutation (e.g., a H588A mutation) or an analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, or partially deactivated Cas9 protein comprises a N611 mutation (e.g., a N611A mutation) or an

analogous substitution to the amino acid corresponding to said position. In some embodiments, a catalytically inactive Cas9 protein, e.g., dCas9, comprises a D16 mutation (e.g., D16A), a D587 mutation (e.g., D587A), a H588 mutation (e.g., H588A), and a N611 mutation (e.g., N611A) or analogous substitutions to the amino acids corresponding to said positions.

In some embodiments, a DNA-binding domain or endonuclease domain may comprise a Cas molecule comprising or linked (e.g., covalently) to a gRNA (e.g., a template nucleic acid, e.g., template RNA, comprising a gRNA).

In some embodiments, an endonuclease domain or DNA binding domain comprises a *Streptococcus pyogenes* Cas9 (SpCas9) or a functional fragment or variant thereof. In some embodiments, the endonuclease domain or DNA binding domain comprises a modified SpCas9. In embodiments, the modified SpCas9 comprises a modification that alters protospacer-adjacent motif (PAM) specificity. In embodiments, the PAM has specificity for the nucleic acid sequence 5′-NGT-3′. In embodiments, the modified SpCas9 comprises one or more amino acid substitutions, e.g., at one or more of positions L1111, D1135, G1218, E1219, A1322, of R1335, e.g., selected from L1111R, D1135V, G1218R, E1219F, A1322R, R1335V. In embodiments, the modified SpCas9 comprises the amino acid substitution T1337R and one or more additional amino acid substitutions, e.g., selected from L1111, D1135L, S1136R, G1218S, E1219V, D1332A, D1332S, D1332T, D1332V, D1332L, D1332K, D1332R, R1335Q, T1337, T1337L, T1337Q, T1337I, T1337V, T1337F, T1337S, T1337N, T1337K, T1337H, T1337Q, and T1337M, or corresponding amino acid substitutions thereto. In embodiments, the modified SpCas9 comprises: (i) one or more amino acid substitutions selected from D1135L, S1136R, G1218S, E1219V, A1322R, R1335Q, and T1337; and (ii) one or more amino acid substitutions selected from L1111R, G1218R, E1219F, D1332A, D1332S, D1332T, D1332V, D1332L, D1332K, D1332R, T1337L, T1337I, T1337V, T1337F, T1337S, T1337N, T1337K, T1337R, T1337H, T1337Q, and T1337M, or corresponding amino acid substitutions thereto.

In some embodiments, the endonuclease domain or DNA binding domain comprises a Cas domain, e.g., a Cas9 domain. In embodiments, the endonuclease domain or DNA binding domain comprises a nuclease-active Cas domain, a Cas nickase (nCas) domain, or a nuclease-inactive Cas (dCas) domain. In embodiments, the endonuclease domain or DNA binding domain comprises a nuclease-active Cas9 domain, a Cas9 nickase (nCas9) domain, or a nuclease-inactive Cas9 (dCas9) domain. In some embodiments, the endonuclease domain or DNA binding domain

comprises a Cas9 domain of Cas9 (e.g., dCas9 and nCas9), Cas12a/Cpfl, Cas12b/C2cl, Cas12c/C2c3, Cas12d/CasY, Cas12e/CasX, Cas12g, Cas12h, or Cas12i. In some embodiments, the endonuclease domain or DNA binding domain comprises a Cas9 (e.g., dCas9 and nCas9), Cas12a/Cpfl, Cas12b/C2cl, Cas12c/C2c3, Cas12d/CasY, Cas12e/CasX, Cas12g, Cas12h, or Cas12i. In some embodiments, the endonuclease domain or DNA binding domain comprises an S. pyogenes or an S. thermophilus Cas9, or a functional fragment thereof. In some embodiments, the endonuclease domain or DNA binding domain comprises a Cas9 sequence, e.g., as described in Chylinski, Rhun, and Charpentier (2013) RNA Biology 10:5, 726-737; incorporated herein by reference. In some embodiments, the endonuclease domain or DNA binding domain comprises the HNH nuclease subdomain and/or the RuvC1 subdomain of a Cas, e.g., Cas9, e.g., as described herein, or a variant thereof. In some embodiments, the endonuclease domain or DNA binding domain comprises Cas12a/Cpfl, Cas12b/C2cl, Cas12c/C2c3, Cas12d/CasY, Cas12e/CasX, Cas12g, Cas12h, or Cas12i. In some embodiments, the endonuclease domain or DNA binding domain comprises a Cas polypeptide (e.g., enzyme), or a functional fragment thereof. In embodiments, the Cas polypeptide (e.g., enzyme) is selected from Cas1, Cas1B, Cas2, Cas3, Cas4, Cas5, Cas5d, Cas5t, Cas5h, Cas5a, Cas6, Cas7, Cas8, Cas8a, Cas8b, Cas8c, Cas9 (e.g., Csn1 or Csx12), Cas10, Cas10d, Cas12a/Cpfl, Cas12b/C2cl, Cas12c/C2c3, Cas12d/CasY, Cas12e/CasX, Cas12g, Cas12h, Cas12i, Csy1 , Csy2, Csy3, Csy4, Cse1, Cse2, Cse3, Cse4, Cse5e, Csc1, Csc2, Csa5, Csn1, Csn2, Csm1, Csm2, Csm3, Csm4, Csm5, Csm6, Cmr1, Cmr3, Cmr4, Cmr5, Cmr6, Csb1, Csb2, Csb3, Csx17, Csx14, Csx10, Csx16, CsaX, Csx3, Csx1, Csx1S, Csx11, Csf1, Csf2, CsO, Csf4, Csd1, Csd2, Cst1, Cst2, Csh1, Csh2, Csa1, Csa2, Csa3, Csa4, Csa5, Type II Cas effector proteins, Type V Cas effector proteins, Type VI Cas effector proteins, CARF, DinG, Cpf1, Cas12b/C2c1, Cas12c/C2c3, Cas12b/C2c1, Cas12c/C2c3, SpCas9(K855A), eSpCas9(1.1), SpCas9-HF1, hyper accurate Cas9 variant (HypaCas9), homologues thereof, modified or engineered versions thereof, and/or functional fragments thereof. In embodiments, the Cas9 comprises one or more substitutions, e.g., selected from H840A, D10A, P475A, W476A, N477A, D1125A, W1126A, and D1127A. In embodiments, the Cas9 comprises one or more mutations at positions selected from: D10, G12, G17, E762, H840, N854, N863, H982, H983, A984, D986, and/or A987, e.g., one or more substitutions selected from D10A, G12A, G17A, E762A, H840A, N854A, N863A, H982A, H983A, A984A, and/or D986A. In some embodiments, the endonuclease domain or DNA

binding domain comprises a Cas (e.g., Cas9) sequence from Corynebacterium ulcerans, Corynebacterium diphtheria, Spiroplasma syrphidicola, Prevotella intermedia, Spiroplasma taiwanense, Streptococcus iniae, Belliella baltica, Psychroflexus torquis, Streptococcus thermophilus, Listeria innocua, Campylobacter jejuni, Neisseria meningitidis, Streptococcus pyogenes, or Staphylococcus aureus, or a fragment or variant thereof.

In some embodiments, the endonuclease domain or DNA binding domain comprises a Cpf1 domain, e.g., comprising one or more substitutions, e.g., at position D917, E1006A, D1255 or any combination thereof, e.g., selected from D917A, E1006A, D1255A, D917A/E1006A, D917A/D1255A, E1006A/D1255A, and D917A/E1006A/D1255A.

In some embodiments, the endonuclease domain or DNA binding domain comprises spCas9, spCas9-VRQR, spCas9- VRER, xCas9 (sp), saCas9, saCas9-KKH, spCas9-MQKSER, spCas9-LRKIQK, or spCas9- LRVSQL.

In some embodiments, a gene modifying polypeptide has an endonuclease domain comprising a Cas9 nickase, e.g., Cas9 H840A. In embodiments, the Cas9 H840A has the following amino acid sequence:

(SEQ ID NO: 5007)

TAL Effectors and Zinc Finger Nucleases

In some embodiments, an endonuclease domain or DNA-binding domain comprises a TAL effector molecule. A TAL effector molecule, e.g., a TAL effector molecule that specifically binds a DNA sequence, typically comprises a plurality of TAL effector domains or fragments thereof, and optionally one or more additional portions of naturally occurring TAL effectors (e.g., N- and/or C-terminal of the plurality of TAL effector domains). Many TAL effectors are known to those of skill in the art and are commercially available, e.g., from Thermo Fisher Scientific.

Naturally occurring TALEs are natural effector proteins secreted by numerous species of bacterial pathogens including the plant pathogen *Xanthomonas* which modulates gene expression in host plants and facilitates bacterial colonization and survival. The specific binding of TAL effectors is based on a central repeat domain of tandemly arranged nearly identical repeats of typically 33 or 34 amino acids (the repeat-variable di-residues, RVD domain).

Members of the TAL effectors family differ mainly in the number and order of their repeats. The number of repeats typically ranges from 1.5 to 33.5 repeats and the C-terminal repeat is usually shorter in length (e.g., about 20 amino acids) and is generally referred to as a "half-repeat." Each repeat of the TAL effector generally features a one-repeat-to-one-base-pair correlation with different repeat types exhibiting different base-pair specificity (one repeat recognizes one base-pair on the target gene sequence). Generally, the smaller the number of repeats, the weaker the protein-DNA interactions. A number of 6.5 repeats has been shown to be sufficient to activate transcription of a reporter gene (Scholze et al., 2010).

Repeat to repeat variations occur predominantly at amino acid positions 12 and 13, which have therefore been termed "hypervariable" and which are responsible for the specificity of the interaction with the target DNA promoter sequence, as shown in Table 9 listing exemplary repeat variable diresidues (RVD) and their correspondence to nucleic acid base targets.

Table 9 – RVDs and Nucleic Acid Base Specificity

Target	Possible RVD Amino Acid Combinations												
A	NI	NN	CI	HI	KI								

G	N N	GN	SN	VN	LN	DN	QN	EN	HN	RH	NK	AN	FN
C	H D	RD	KD	ND	AD								
T	N G	HG	VG	IG	EG	MG	YG	AA	EP	VA	QG	KG	RG

Accordingly, it is possible to modify the repeats of a TAL effector to target specific DNA sequences. Further studies have shown that the RVD NK can target G. Target sites of TAL effectors also tend to include a T flanking the 5′ base targeted by the first repeat, but the exact mechanism of this recognition is not known. More than 113 TAL effector sequences are known to date. Non-limiting examples of TAL effectors from *Xanthomonas* include, Hax2, Hax3, Hax4, AvrXa7, AvrXa10 and AvrBs3.

Accordingly, the TAL effector domain of a TAL effector molecule described herein may be derived from a TAL effector from any bacterial species (e.g., *Xanthomonas* species such as the African strain of *Xanthomonas oryzae* pv. *Oryzae* (Yu et al. 2011), *Xanthomonas campestris* pv. *raphani* strain 756C and *Xanthomonas oryzae* pv. *oryzicola*strain BLS256 (Bogdanove et al. 2011). In some embodiments, the TAL effector domain comprises an RVD domain as well as flanking sequence(s) (sequences on the N-terminal and/or C-terminal side of the RVD domain) also from the naturally occurring TAL effector. It may comprise more or fewer repeats than the RVD of the naturally occurring TAL effector. The TAL effector molecule can be designed to target a given DNA sequence based on the above code and others known in the art. The number of TAL effector domains (e.g., repeats (monomers or modules)) and their specific sequence can beselected based on the desired DNA target sequence. For example, TAL effector domains, e.g., repeats, may be removed or added in order to suit a specific target sequence. In an embodiment, the TAL effector molecule of the present invention comprises between 6.5 and 33.5 TAL effector domains, e.g., repeats. In an embodiment, TAL effector molecule of the present invention comprises between 8 and 33.5 TAL effector domains, e.g., repeats, e.g., between 10 and 25 TAL effector domains, e.g., repeats, e.g., between 10 and 14 TAL effector domains, e.g., repeats.

In some embodiments, the TAL effector molecule comprises TAL effector domains that correspond to a perfect match to the DNA target sequence. In some embodiments, a mismatch between a repeat and a target base-pair on the DNA target sequence is permitted as along as it allows for the function of the polypeptide comprising the TAL effector molecule. In general, TALE binding is inversely correlated with the number of mismatches. In some embodiments, the TAL effector molecule of a polypeptide of the present invention comprises no more than 7 mismatches, 6 mismatches, 5 mismatches, 4 mismatches, 3 mismatches, 2 mismatches, or 1 mismatch, and optionally no mismatch, with the target DNA sequence. Without wishing to be bound by theory, in general the smaller the number of TAL effector domains in the TAL effector molecule, the smaller the number of mismatches will be tolerated and still allow for the function of the polypeptide comprising the TAL effector molecule. The binding affinity is thought to depend on the sum of matching repeat-DNA combinations. For example, TAL effector molecules having 25 TAL effector domains or more may be able to tolerate up to 7 mismatches.

In addition to the TAL effector domains, the TAL effector molecule of the present invention may comprise additional sequences derived from a naturally occurring TAL effector. The length of the C-terminal and/or N-terminal sequence(s) included on each side of the TAL effector domain portion of the TAL effector molecule can vary and be selected by one skilled in the art, for example based on the studies of Zhang et al. (2011). Zhang et al., have characterized a number of C-terminal and N-terminal truncation mutants in Hax3 derived TAL-effector based proteins and have identified key elements, which contribute to optimal binding to the target sequence and thus activation of transcription. Generally, it was found that transcriptional activity is inversely correlated with the length of N-terminus. Regarding the C-terminus, an important element for DNA binding residues within the first 68 amino acids of the Hax 3 sequence was identified. Accordingly, in some embodiments, the first 68 amino acids on the C-terminal side of the TAL effector domains of the naturally occurring TAL effector is included in the TAL effector molecule. Accordingly, in an embodiment, a TAL effector molecule comprises 1) one or more TAL effector domains derived from a naturally occurring TAL effector; 2) at least 70, 80, 90, 100, 110, 120, 130, 140, 150, 170, 180, 190, 200, 220, 230, 240, 250, 260, 270, 280 or more amino acids from the naturally occurring TAL effector on the N-terminal side of the TAL effector domains; and/or 3) at least 68, 80, 90, 100, 110, 120, 130, 140, 150, 170, 180, 190,

200, 220, 230, 240, 250, 260 or more amino acids from the naturally occurring TAL effector on the C-terminal side of the TAL effector domains.

In some embodiments, an endonuclease domain or DNA-binding domain is or comprises a Zn finger molecule. A Zn finger molecule comprises a Zn finger protein, e.g., a naturally occurring Zn finger protein or engineered Zn finger protein, or fragment thereof. Many Zn finger proteins are known to those of skill in the art and are commercially available, e.g., from Sigma-Aldrich.

In some embodiments, a Zn finger molecule comprises a non-naturally occurring Zn finger protein that is engineered to bind to a target DNA sequence of choice. See, for example, Beerli, et al. (2002) Nature Biotechnol. 20:135-141; Pabo, et al. (2001) Ann. Rev. Biochem. 70:313-340; Isalan, et al. (2001) Nature Biotechnol. 19:656-660; Segal, et al. (2001) Curr. Opin. Biotechnol. 12:632-637; Choo, et al. (2000) Curr. Opin. Struct. Biol. 10:411-416; U.S. Pat. Nos. 6,453,242; 6,534,261; 6,599,692; 6,503,717; 6,689,558; 7,030,215; 6,794,136; 7,067,317; 7,262,054; 7,070,934; 7,361,635; 7,253,273; and U.S. Patent Publication Nos. 2005/0064474; 2007/0218528; 2005/0267061, all incorporated herein by reference in their entireties.

An engineered Zn finger protein may have a novel binding specificity, compared to a naturally-occurring Zn finger protein. Engineering methods include, but are not limited to, rational design and various types of selection. Rational design includes, for example, using databases comprising triplet (or quadruplet) nucleotide sequences and individual Zn finger amino acid sequences, in which each triplet or quadruplet nucleotide sequence is associated with one or more amino acid sequences of zinc fingers which bind the particular triplet or quadruplet sequence. See, for example, U.S. Pat. Nos. 6,453,242 and 6,534,261, incorporated by reference herein in their entireties.

Exemplary selection methods, including phage display and two-hybrid systems, are disclosed in U.S. Pat. Nos. 5,789,538; 5,925,523; 6,007,988; 6,013,453; 6,410,248; 6,140,466; 6,200,759; and 6,242,568; as well as International Patent Publication Nos. WO 98/37186; WO 98/53057; WO 00/27878; and WO 01/88197 and GB 2,338,237. In addition, enhancement of binding specificity for zinc finger proteins has been described, for example, in International Patent Publication No. WO 02/077227.

In addition, as disclosed in these and other references, zinc finger domains and/or multi-fingered zinc finger proteins may be linked together using any suitable linker sequences, including for example, linkers of 5 or more amino acids in length. See, also, U.S. Pat. Nos. 6,479,626; 6,903,185; and 7,153,949 for exemplary linker sequences 6 or more amino acids in length. The proteins described herein may include any combination of suitable linkers between the individual zinc fingers of the protein. In addition, enhancement of binding specificity for zinc finger binding domains has been described, for example, in co-owned International Patent Publication No. WO 02/077227.

Zn finger proteins and methods for design and construction of fusion proteins (and polynucleotides encoding same) are known to those of skill in the art and described in detail in U.S. Pat. Nos. 6,140,0815; 789,538; 6,453,242; 6,534,261; 5,925,523; 6,007,988; 6,013,453; and 6,200,759; International Patent Publication Nos. WO 95/19431; WO 96/06166; WO 98/53057; WO 98/54311; WO 00/27878; WO 01/60970; WO 01/88197; WO 02/099084; WO 98/53058; WO 98/53059; WO 98/53060; WO 02/016536; and WO 03/016496.

In addition, as disclosed in these and other references, Zn finger proteins and/or multi-fingered Zn finger proteins may be linked together, e.g., as a fusion protein, using any suitable linker sequences, including for example, linkers of 5 or more amino acids in length. See, also, U.S. Pat. Nos. 6,479,626; 6,903,185; and 7,153,949 for exemplary linker sequences 6 or more amino acids in length. The Zn finger molecules described herein may include any combination of suitable linkers between the individual zinc finger proteins and/or multi-fingered Zn finger proteins of the Zn finger molecule.

In certain embodiments, the DNA-binding domain or endonuclease domain comprises a Zn finger molecule comprising an engineered zinc finger protein that binds (in a sequence-specific manner) to a target DNA sequence. In some embodiments, the Zn finger molecule comprises one Zn finger protein or fragment thereof. In other embodiments, the Zn finger molecule comprises a plurality of Zn finger proteins (or fragments thereof), e.g., 2, 3, 4, 5, 6 or more Zn finger proteins (and optionally no more than 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, or 2 Zn finger proteins). In some embodiments, the Zn finger molecule comprises at least three Zn finger proteins. In some embodiments, the Zn finger molecule comprises four, five or six fingers. In some embodiments, the Zn finger molecule comprises 8, 9, 10, 11 or 12 fingers. In some embodiments, a Zn finger molecule comprising three Zn finger proteins recognizes a target DNA

sequence comprising 9 or 10 nucleotides. In some embodiments, a Zn finger molecule comprising four Zn finger proteins recognizes a target DNA sequence comprising 12 to 14 nucleotides. In some embodiments, a Zn finger molecule comprising six Zn finger proteins recognizes a target DNA sequence comprising 18 to 21 nucleotides.

In some embodiments, a Zn finger molecule comprises a two-handed Zn finger protein. Two handed zinc finger proteins are those proteins in which two clusters of zinc finger proteins are separated by intervening amino acids so that the two zinc finger domains bind to two discontinuous target DNA sequences. An example of a two handed type of zinc finger binding protein is SIP1, where a cluster of four zinc finger proteins is located at the amino terminus of the protein and a cluster of three Zn finger proteins is located at the carboxyl terminus (see Remade, et al. (1999) EMBO Journal 18(18):5073-5084). Each cluster of zinc fingers in these proteins is able to bind to a unique target sequence and the spacing between the two target sequences can comprise many nucleotides.

Linkers

In some embodiments, a gene modifying polypeptide may comprise a linker, e.g., a peptide linker, e.g., a linker as described in Table 10. In some embodiments, a gene modifying polypeptide comprises, in an N-terminal to C-terminal direction, a Cas domain (e.g., a Cas domain of Table 8), a linker of Table 10 (or a sequence having at least 70%, 80%, 85%, 90%, 95%, or 99% identity thereto), and an RT domain (e.g., an RT domain of Table 6). In some embodiments, a gene modifying polypeptide comprises a flexible linker between the endonuclease and the RT domain, e.g., a linker comprising the amino acid sequence SGGSSGGSSGSETPGTSESATPESSGGSSGGSS (SEQ ID NO: 11,002). In some embodiments, an RT domain of a gene modifying polypeptide may be located C-terminal to the endonuclease domain. In some embodiments, an RT domain of a gene modifying polypeptide may be located N-terminal to the endonuclease domain.

In some embodiments, a linker of a gene modifying polypeptide comprises a motif chosen from: $(SGGS)_n$ (SEQ ID NO: 5025), $(GGGS)_n$ (SEQ ID NO: 5026), $(GGGGS)_n$ (SEQ ID NO: 5027), $(G)_n$, $(EAAAK)_n$ (SEQ ID NO: 5028), $(GGS)_n$, or $(XP)_n$.

Gene modifying polypeptide selection by pooled screening

Candidate gene modifying polypeptides may be screened to evaluate a candidate's gene editing ability. For example, an RNA gene modifying system designed for the targeted editing of a coding sequence in the human genome may be used. In certain embodiments, such a gene modifying system may be used in conjunction with a pooled screening approach.

For example, a library of gene modifying polypeptide candidates and a template guide RNA (tgRNA) may be introduced into mammalian cells to test the candidates' gene editing abilities by a pooled screening approach. In specific embodiments, a library of gene modifying polypeptide candidates is introduced into mammalian cells followed by introduction of the tgRNA into the cells.

Representative, non-limiting examples of mammalian cells that may be used in screening include HEK293T cells, U2OS cells, HeLa cells, HepG2 cells, Huh7 cells, K562 cells, or iPS cells.

A gene modifying polypeptide candidate may comprise 1) a Cas-nuclease, for example a wild-type Cas nuclease, e.g., a wild-type Cas9 nuclease, a mutant Cas nuclease, e.g., a Cas nickase, for example, a Cas9 nickase such as a Cas9 N863A nickase, or a Cas nuclease selected from **Table 7 or Table 8**, 2) a peptide linker, e.g., a sequence from **Table D or Table 10,** that may exhibit varying degrees of length, flexibility, hydrophobicity, and/or secondary structure; and 3) a reverse transcriptase (RT), e.g. an RT domain from **Table D or Table 6**. A gene modifying polypeptide candidate library comprises: a plurality of different gene modifying polypeptide candidates that differ from each other with respect to one, two or all three of the Cas nuclease, peptide linker or

RT domain components, or a plurality of nucleic acid expression vectors that encode such gene modifying polypeptide candidates.

For screening of gene modifying polypeptide candidates, a two-component system may be used that comprises a gene modifying polypeptide component and a tgRNA component. A gene modifying component may comprise, for example, an expression vector, e.g., an expression plasmid or lentiviral vector, that encodes a gene modifying polypeptide candidate, for example, comprises a human codon-optimized nucleic acid that encodes a gene modifying polypeptide candidate, e.g., a Cas-linker-RT fusion as described above. In a particular embodiment, a lentiviral cassette is utilized that comprises: (i) a promoter for expression in mammalian cells, e.g., a CMV promoter; (ii) a gene modifying library candidate, e.g. a Cas-linker-RT fusion comprising a Cas nuclease of **Table 7 or Table 8**, a peptide linker of **Table 10**, and an RT of **Table 6**, for example a Cas-linker-RT fusion as in **Table D**; (iii) a self-cleaving polypeptide, e.g., a T2A peptide; (iv) a marker enabling selection in mammalian cells, e.g., a puromycin resistance gene; and (v) a termination signal, e.g., a poly A tail.

The tgRNA component may comprise a tgRNA or expression vector, e.g., an expression plasmid, that produces the tgRNA, for example, utilizes a U6 promoter to drive expression of the tgRNA, wherein the tgRNA is a non-coding RNA sequence that is recognized by Cas and localizes it to the genomic locus of interest, and that also templates reverse transcription of the desired edit into the genome by the RT domain.

To prepare a pool of cells expressing gene modifying polypeptide library candidates, mammalian cells, e.g., HEK293T or U2OS cells, may be transduced with pooled gene modifying polypeptide candidate expression vector preparations, e.g., lentiviral preparations, of the gene modifying candidate polypeptide library. In a particular embodiment, lentiviral plasmids are utilized, and HEK293 Lenti-X cells are seeded in 15 cm plates (~$12x10^6$ cells) prior to lentiviral plasmid transfection. In such an embodiment, lentiviral plasmid transfection may be performed using the Lentiviral Packaging Mix (Biosettia) and transfection of the plasmid DNA for the gene modifying candidate library is performed the following day using Lipofectamine 2000 and Opti-MEM media according to the manufacturer's protocol. In such an embodiment, extracellular DNA may be removed by a full media change the next day and virus-containing media may be harvested 48 hours after. Lentiviral media may be concentrated using Lenti-X Concentrator (TaKaRa

Biosciences) and 5 mL lentiviral aliquots may be made and stored at -80°C. Lentiviral titering is performed by enumerating colony forming units post-selection, e.g., post Puromycin selection.

For monitoring gene editing of a target DNA, mammalian cells, e.g., HEK293T or U2OS cells, carrying a target DNA may be utilized. In other embodiments for monitoring gene editing of a target DNA, mammalian cells, e.g., HEK293T or U2OS cells, carrying a target DNA genomic landing pad may be utilized. In particular embodiments, the target DNA genomic landing pad may comprise a gene to be edited for treatment of a disease or disorder of interest. In other particular embodiments, the target DNA is a gene sequence that expresses a protein that exhibits detectable characteristics that may be monitored to determine whether gene editing has occurred. For example, in certain embodiments, a blue fluorescence protein (BFP)- or green fluorescence protein (GFP)-expressing genomic landing pad is utilized. In certain embodiments, mammalian cells, e.g., HEK293T or U2OS cells, comprising a target DNA, e.g., a target DNA genomic landing pad, are seeded in culture plates at 500x-3000x cells per gene modifying library candidate and transduced at a 0.2-0.3 multiplicity of infection (MOI) to minimize multiple infections per cell. Puromycin (2.5 ug/mL) may be added 48 hours post infection to allow for selection of infected cells. In such an embodiment, cells may be kept under puromycin selection for at least 7 days and then scaled up for tgRNA introduction, e.g., tgRNA electroporation.

To ascertain whether gene editing occurs, mammalian cells containing a target DNA to be edited may be infected with gene modifying polypeptide library candidates then transfected with tgRNA designed for use in editing of the target DNA. Subsequently, the cells may be analyzed to determine whether editing of the target locus has occurred according to the designed outcome, or whether no editing or imperfect editing has occurred, e.g., by using cell sorting and sequence analysis.

In a particular embodiment, to ascertain whether genome editing occurs, BFP- or GFP-expressing mammalian cells, e.g., HEK293T or U2OS cells, may be infected with gene modifying library candidates and then transfected or electroporated with tgRNA plasmid or RNA, e.g., by electroporation of 250,000 cells/well with 200 ng of a tgRNA plasmid designed to convert BFP-to-GFP or GFP-to-BFP, at a cell count ensuring >250x-1000x coverage per library candidate. In such an embodiment, the genome-editing capacity of the various constructs in this assay may be assessed by sorting the cells by Fluorescence-Activated Cell Sorting (FACS) for expression of the color-converted fluorescent protein (FP) at 4-10 days post-electroporation. Cells are sorted and

harvested as distinct populations of unedited cells (exhibiting original florescence protein signal), edited cells (exhibiting converted fluorescence protein signal), and imperfect edit (exhibiting no florescence protein signal) cells. A sample of unsorted cells may also be harvested as the input population to determine candidate enrichment during analysis.

To determine which gene modifying library candidates exhibit genome-editing capacity in an assay, genomic DNA (gDNA) is harvested from the sorted cell populations, and analyzed by sequencing the gene modifying library candidates in each population. Briefly, gene modifying candidates may be amplified from the genome using primers specific to the gene modifying polypeptide expression vector, e.g., the lentiviral cassette, amplified in a second round of PCR to dilute genomic DNA, and then sequenced, for example, sequenced by a next-generation sequencing platform. After quality control of sequencing reads, reads of at least about 1500 nucleotides and generally no more than about 3200 nucleotides are mapped to the gene modifying polypeptide library sequences and those containing a minimum of about an 80% match to a library sequence are considered to be successfully aligned to a given candidate for purposes of this pooled screen. In order to identify candidates capable of performing gene editing in the assay, e.g., the BFP-to-GFP or GFP-to-BFP edit, the read count of each library candidate in the edited population is compared to its read count in the initial, unsorted population.

For purposes of pooled screening, gene modifying candidates with genome-editing capacity are identified based on enrichment in the edited (converted FP) population relative to unsorted (input) cells. In some embodiments, an enrichment of at least 1.0, 1.5, 2.0, 2.5, 3.0, 4.0, 5.0, 6.0, 7.0, 8.0, 9.0, 10, 15, 20, 25, 30, 40, 50, 60, 70, 80, 90, or at least 100-fold over the input indicates potentially useful gene editing activity, e.g., at least 2-fold enrichment. In some embodiments, the enrichment is converted to a log-value by taking the log base 2 of the enrichment ratio. In some embodiments, a log2 enrichment score of at least 0, 1, 2, 3, 4, 5, 5.5, 6.0, 6.2, 6.3, 6.4, 6.5, or at least 6.6 indicates potentially useful gene editing activity, e.g., a log2 enrichment score of at least 1.0. In particular embodiments, enrichment values observed for gene modifying candidates may be compared to enrichment values observed under similar conditions utilizing a reference, e.g., Element ID No: 17380.

In some embodiments, multiple tgRNAs may be used to screen the gene modifying candidate library. In particular embodiments, a plurality of tgRNAs may be utilized to optimize template/Cas-linker-RT fusion pairs, e.g., for gene editing of particular target genes, for example,

gene targets for the treatment of disease. In specific embodiments, a pooled approach to screening gene modifying candidates may be performed using a multiplicity of different tgRNAs in an arrayed format.

In some embodiments, multiple types of edits, e.g., insertions, substitutions, and/or deletions of different lengths, may be used to screen the gene modifying candidate library.

In some embodiments, multiple target sequences, e.g., different fluorescent proteins, may be used to screen the gene modifying candidate library. In some embodiments, multiple target sequences, e.g., different fluorescent proteins, may be used to screen the gene modifying candidate library. In some embodiments, multiple cell types, e.g., HEK293T or U2OS, may be used to screen the gene modifying candidate library. The person of ordinary skill in the art will appreciate that a given candidate may exhibit altered editing capacity or even the gain or loss of any observable or useful activity across different conditions, including tgRNA sequence (e.g., nucleotide modifications, PBS length, RT template length), target sequence, target location, type of edit, location of mutation relative to the first-strand nick of the gene modifying polypeptide, or cell type. Thus, in some embodiments, gene modifying library candidates are screened across multiple parameters, e.g., with at least two distinct tgRNAs in at least two cell types, and gene editing activity is identified by enrichment in any single condition. In other embodiments, a candidate with more robust activity across different tgRNA and cell types is identified by enrichment in at least two conditions, e.g., in all conditions screened. For clarity, candidates found to exhibit little to no enrichment under any given condition are not assumed to be inactive across all conditions and may be screened with different parameters or reconfigured at the polypeptide level, e.g., by swapping, shuffling, or evolving domains (e.g., RT domain), linkers, or other signals (e.g., NLS).

Sequences of exemplary Cas9-linker-RT fusions

In some embodiments, a gene modifying polypeptide comprises a linker sequence and an RT sequence. In some embodiments, a gene modifying polypeptide comprises a linker sequence as listed in Table D, or an amino acid sequence having at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises the amino acid sequence of an RT domain as listed in Table D, or an amino acid sequence having at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises a linker sequence as listed in

Table D, or an amino acid sequence having at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto; and the amino acid sequence of an RT domain as listed in Table D, or an amino acid sequence having at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises: (i) a linker sequence as listed in a row of Table D, or an amino acid sequence having at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto; and (ii) the amino acid sequence of an RT domain as listed in the same row of Table D, or an amino acid sequence having at least 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% identity thereto.

Exemplary Gene Modifying Polypeptides

In some embodiments, a gene modifying polypeptide (e.g., a gene modifying polypeptide that is part of a system described herein) comprises an amino acid sequence of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises an amino acid sequence of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 80% identity thereto. In some embodiments, a gene modifying polypeptide comprises an amino acid sequence of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 90% identity thereto. In some embodiments, a gene modifying polypeptide comprises an amino acid sequence of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 95% identity thereto. In some embodiments, a gene modifying polypeptide comprises an amino acid sequence of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises an amino acid sequence of any one of SEQ ID NOs: 1-7743. In some embodiments, a gene modifying polypeptide comprises an amino acid sequence of any one of SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises an amino acid sequence of any one of SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In some embodiments, a gene modifying polypeptide comprises an amino acid sequence as listed in Table A1, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In some embodiments, a gene modifying polypeptide comprises an amino acid sequence as listed in Table T1, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises a linker comprising a linker sequence as listed in Table T1, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises an RT domain comprising an RT domain sequence as listed in Table T1, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, a gene modifying polypeptide comprises: (i) a linker comprising a linker sequence as listed in a row of Table T1, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto; and (ii) an RT domain comprising an RT domain sequence as listed in the same row of Table T1, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

Subsequences of Exemplary Gene Modifying Polypeptides

In some embodiments, the gene modifying polypeptide comprises, in N-terminal to C-terminal order, one or more (e.g., 1, 2, 3, 4, 5, or all 6) of an N-terminal methionine residue, a first nuclear localization signal (NLS), a DNA binding domain, a linker, an RT domain, and/or a second NLS. In some embodiments, a gene modifying polypeptide comprises, in N-terminal to C-terminal order, a NLS (e.g., a first NLS), a DNA binding domain, a linker, and an RT domain, wherein the linker and RT domain are the linker and RT domain of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said linker and RT domain. In some embodiments, a gene modifying polypeptide comprises, in N-terminal to C-terminal order, a DNA binding domain, a linker, an RT domain, and an NLS (e.g., a second NLS) wherein the linker and RT domain are the linker and RT domain of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said linker and RT domain. In some embodiments, a gene modifying polypeptide comprises, in N-terminal to C-terminal order, a first NLS, a DNA binding domain, a linker, an RT domain, and a second NLS, wherein the linker and RT domain are the linker and RT domain of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said linker and RT domain. In some embodimetns, the gene modifying polypeptide further comprises an N-terminal methionine residue.

In some embodiments, the gene modifying polypeptide comprises, in N-terminal to C-terminal order, one or more (e.g., 1, 2, 3, 4, 5, or all 6) of an N-terminal methionine residue, a first nuclear localization signal (NLS) (e.g., of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743 and/or as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto), a DNA binding domain (e.g., a Cas domain, e.g., a SpyCas9 domain, e.g., as listed in Table 8, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto; or a DNA binding domain of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743 and/or as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto), a linker (e.g., of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743 and/or as listed in any of Tables A1, T1, or T2, or an amino acid

sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto), an RT domain (e.g., of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743 and/or as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto), and a second NLS (e.g., of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743 and/or as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto). In some embodiments, the gene modifying polypeptide further comprises (e.g., C-terminal to the second NLS) a T2A sequence and/or a puromycin sequence (e.g., of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743 and/or as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto). In some embodiments, a nucleic acid encoding a gene modifying polypeptide (e.g., as described herein) encodes a T2A sequence, e.g., wherein the T2A sequence is situated between a region encoding the gene modifying polypeptide and a second region, wherein the second region optionally encodes a selectable marker, e.g., puromycin.

In certain embodiments, the first NLS comprises a first NLS sequence of a gene modifying polypeptide having an amino acid sequence of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the first NLS comprises a first NLS sequence of a gene modifying polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the first NLS sequence comprises a C-myc NLS. In certain embodiments, the first NLS comprises the amino acid sequence PAAKRVKLD (SEQ ID NO: 11,095) , or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the gene modifying polypeptide further comprises a spacer sequence between the first NLS and the DNA binding domain. In certain embodiments, the spacer sequence between the first NLS and the DNA binding domain comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 amino acids. In certain embodiments, the spacer sequence between the first NLS and the DNA binding domain comprises the amino acid sequence GG.

In certain embodiments, the DNA binding domain comprises a DNA binding domain of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain

embodiments, the DNA binding domain comprises a DNA binding domain of a gene modifying polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the DNA binding domain comprises a Cas domain (e.g., as listed in Table 8). In certain embodiments, the DNA binding domain comprises the amino acid sequence of a SpyCas9 polypeptide (e.g., as listed in Table 8, e.g., a Cas9 N863A polypeptide), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the DNA binding domain comprises the amino acid sequence:

or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the gene modifying polypeptide further comprises a spacer sequence between the DNA binding domain and the linker. In certain embodiments, the spacer sequence between the DNA binding domain and the linker comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 amino acids. In certain embodiments, the spacer sequence between the DNA binding domain and the linker comprises the amino acid sequence GG.

In certain embodiments, the linker comprises a linker sequence of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the linker comprises a linker sequence of a gene modifying polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the linker comprises an amino acid sequence as listed in Table D or 10, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the gene modifying polypeptide further comprises a spacer sequence between the linker and the RT domain. In certain embodiments, the spacer sequence between the linker and the RT domain comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 amino acids. In certain embodiments, the spacer sequence between the linker and the RT domain comprises the amino acid sequence GG.

In certain embodiments, the RT domain comprises a RT domain sequence of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the RT domain comprises a RT domain sequence of a gene modifying polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the RT domain comprises an amino acid sequence as listed in Table D or 6, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain has a length of about 400-500, 500-600, 600-700, 700-800, 800-900, or 900-1000 amino acids.

In certain embodiments, the gene modifying polypeptide further comprises a spacer sequence between the RT domain and the second NLS. In certain embodiments, the spacer

sequence between the RT domain and the second NLS comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 amino acids. In certain embodiments, the spacer sequence between the RT domain and the second NLS comprises the amino acid sequence AG.

In certain embodiments, the second NLS comprises a second NLS sequence of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743. In certain embodiments, the second NLS comprises a second NLS sequence of a gene modifying polypeptide as listed in any of Tables A1, T1, or T2. In certain embodiments, the second NLS sequence comprises a plurality of partial NLS sequences. In embodiments, the NLS sequence, e.g., the second NLS sequence, comprises a first partial NLS sequence, e.g., comprising the amino acid sequence KRTADGSEFE (SEQ ID NO: 11,097), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In embodiments, the NLS sequence, e.g., the second NLS sequence, comprises a second partial NLS sequence. In embodiments, the NLS sequence, e.g., the second NLS sequence, comprises an SV40A5 NLS, e.g., a bipartite SV40A5 NLS, e.g., comprising the amino acid sequence KRTADGSEFESPKKKAKVE (SEQ ID NO: 11,098), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the NLS sequence, e.g., the second NLS sequence, comprises the amino acid sequence KRTADGSEFEKRTADGSEFESPKKKAKVE (SEQ ID NO: 11,099), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the gene modifying polypeptide further comprises a spacer sequence between the second NLS and the T2A sequence and/or puromycin sequence. In certain embodiments, the spacer sequence between the second NLS and the T2A sequence and/or puromycin sequence comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 amino acids. In certain embodiments, the spacer sequence between the second NLS and the T2A sequence and/or puromycin sequence comprises the amino acid sequence GSG.

Linkers and RT domains

In some embodiments, the gene modifying polypeptide comprises a linker (e.g., as described herein) and an RT domain (e.g., as described herein). In certain embodiments, the gene modifying polypeptide comprises, in N-terminal to C-terminal order, a linker (e.g., as described herein) and an RT domain (e.g., as described herein).

In certain embodiments, the linker comprises a linker sequence as listed in Table 10, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the linker comprises a linker sequence of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the linker comprises a linker sequence of any one of SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the linker comprises a linker sequence of any one of SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the linker comprises a linker sequence of an exemplary gene modifying polypeptide listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the RT domain comprises an RT domain sequence as listed in Table 6, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the RT domain comprises an RT domain sequence of an exemplary gene modifying polypeptide listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In some embodiments, a gene modifying polypeptide comprises a portion of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, wherein the portion comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion.

In some embodiments, a gene modifying polypeptide comprises a linker of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said linker. In some embodiments, a gene modifying polypeptide comprises a linker of a gene modifying polypeptide of any one of SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said linker. In some embodiments, a gene modifying polypeptide comprises a linker of a gene modifying polypeptide of any one of SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said linker. In some embodiments, a gene modifying polypeptide comprises a linker of a gene

modifying polypeptide as listed in any of Tables A1, T1, or T2, or a linker comprising an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In some embodiments, a gene modifying polypeptide comprises an RT domain of a gene modifying polypeptide of any one of SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said RT domain. In some embodiments, a gene modifying polypeptide comprises an RT domain of a gene modifying polypeptide of any one of SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity said RT domain. In some embodiments, a gene modifying polypeptide comprises an RT domain of a gene modifying polypeptide of any one of SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity said RT domain. In some embodiments, a gene modifying polypeptide comprises an RT domain of a gene modifying polypeptide as listed in any of Tables A1, T1, or T2, or an RT domain comprising an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise the amino acid sequences of a linker and RT domain (or amino acid sequences having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto) of a gene modifying polypeptide having the amino acid sequence of any one of SEQ ID NOs: 1-7743. In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise amino acid sequences of a linker and RT domain having at least 80% identity to the linker and RT domains of any one of SEQ ID NOs: 1-7743. In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise amino acid sequences of a linker and RT domain having at least 90% identity to the linker and RT domains of any one of SEQ ID NOs: 1-7743. In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise amino acid sequences of a linker and RT domain having at least 95% identity to the linker and RT domains of any one of SEQ ID NOs: 1-7743. In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise amino acid sequences of a linker and RT domain having at least 99% identity to the linker and RT domains of any one of SEQ ID NOs: 1-7743. In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise the amino acid sequences of a linker and RT domain (or amino acid sequences having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto) of a gene

modifying polypeptide having the amino acid sequence of any one of SEQ ID NOs: 6001-7743. In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise the amino acid sequences of a linker and RT domain (or amino acid sequences having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto) of a gene modifying polypeptide having the amino acid sequence of any one of SEQ ID NOs: 4501-4541. In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise the amino acid sequences of a linker and RT domain (or amino acid sequences having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto) from a single row of any of Tables A1, T1, or T2 (e.g., from a single exemplary gene modifying polypeptide as listed in any of Tables A1, T1, or T2).

In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise the amino acid sequences of a linker and RT domain (or amino acid sequences having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto) from two different amino acid sequences selected from SEQ ID NOs: 1-7743. In certain embodiments, the linker and the RT domain of a gene modifying polypeptide comprise the amino acid sequences of a linker and RT domain (or amino acid sequences having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto) from different rows of any of Tables A1, T1, or T2.

In certain embodiments, the gene modifying polypeptide further comprises a first NLS (e.g., a 5’ NLS), e.g., as described herein. In certain embodiments, the gene modifying polypeptide further comprises a second NLS (e.g., a 3’ NLS), e.g., as described herein. In certain embodiments, the gene modifying polypeptide further comprises an N-terminal methionine residue.

RT Families and Mutants

In certain embodiments, a gene modifying polypeptide comprises comprises the amino acid sequence of an RT domain sequence from a family selected from: AVIRE, BAEVM, FFV, FLV, FOAMV, GALV, KORV, MLVAV, MLVBM, MLVCB, MLVFF, MLVMS, PERV, SFV1, SFV3L, WMSV, XMRV6, BLVAU, BLVJ, HTL1A, HTL1C, HTL1L, HTL32, HTL3P, HTLV2, JSRV, MLVF5, MLVRD, MMTVB, MPMV, SFVCP, SMRVH, SRV1, SRV2, and WDSV. In certain embodiments, a gene modifying polypeptide comprises comprises the amino acid sequence of an RT domain sequence from a family selected from: AVIRE, BAEVM, FFV,

FLV, FOAMV, GALV, KORV, MLVAV, MLVBM, MLVCB, MLVFF, MLVMS, PERV, SFV1, SFV3L, WMSV, and XMRV6.

In certain embodiments, a gene modifying polypeptide comprises comprises the amino acid sequence of an RT domain sequence from an MLVMS RT domain. In embodiments, the amino acid sequence of an RT domain sequence comprises one or more point mutations as listed in column 1 of Table M1, or a point mutation corresponding thereto. In embodiments, the amino acid sequence of an RT domain sequence comprises one or more point mutations as listed in column 3 of Table M1 (Gen1 MLVMS), or a point mutation corresponding thereto. In embodiments, the amino acid sequence of an RT domain sequence comprises one or more point mutations at an amino acid position of the RT domain as listed in columns 1 and 2 of Table M2, or an amino acid position corresponding thereto.

In certain embodiments, a gene modifying polypeptide comprises comprises the amino acid sequence of an RT domain sequence from an AVIRE RT domain. In embodiments, the amino acid sequence of an RT domain sequence comprises one or more point mutations as listed in column 2 of Table M1, or a point mutation corresponding thereto. In embodiments, the amino acid sequence of an RT domain sequence comprises one or more point mutations as listed in column 4 of Table M1 (Gen2 AVIRE), or a point mutation corresponding thereto. In embodiments, the amino acid sequence of an RT domain sequence comprises one or more point mutations at an amino acid position of the RT domain as listed in columns 3 and 4 of Table M2, or an amino acid position corresponding thereto. In certain embodiments, the RT domain comprises an IENSSP (SEQ ID NO: 37639) (e.g., at the C-terminus).

In certain embodiments, a gene modifying polypeptide comprises a gamma retrovirus derived RT domain. In certain embodiments, the gamma retrovirus-derived RT domain of a gene modifying polypeptide comprises the amino acid sequence of an RT domain sequence from a family selected from: AVIRE, BAEVM, FFV, FLV, FOAMV, GALV, KORV, MLVAV, MLVBM, MLVCB, MLVFF, MLVMS, PERV, SFV1, SFV3L, WMSV, and XMRV6. In some embodiments, the gamma retrovirus-derived RT domain of a gene modifying polypeptide is not derived from PERV. In some embodiments, said RT includes one, two, three, four, five, six or more mutations shown in Table 2 and corresponding to mutations D200N, L603W, T330P, D524G, E562Q, D583N, P51L, S67R, E67K, T197A, H204R, E302K, F309N, W313F, L435G, N454K, H594Q, L671P, E69K, or D653N in the RT domain of murine leukemia virus reverse transcriptase. In some embodiments, the gene modifying polypeptide further comprises a linker having at least 99% identity to a linker domains of any one of SEQ ID NOs: 1-7743. In some embodiments, the gene modifying polypeptide further comprises a linker having at least 99% or 100% identity to SEQ ID NO: 5217 or SEQ ID NO:11,041.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of an AVIRE RT (e.g., an AVIRE_P03360 sequence, e.g., SEQ ID NO: 8001), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of an AVIRE RT further comprising one, two, three, four, or five mutations selected from the group consisting of D200N, G330P, L605W, T306K, and W313F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an AVIRE RT further comprising one, two, or three mutations selected from the group consisting of D200N, G330P, and L605W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a BAEVM RT (e.g., an BAEVM_P10272 sequence, e.g., SEQ ID NO: 8004), or an amino acid

sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a BAEVM RT further comprising one, two, three, four, or five mutations selected from the group consisting of D198N, E328P, L602W, T304K, and W311F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a BAEVM RT further comprising one, two, or three mutations selected from the group consisting of D198N, E328P, and L602W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of an FFV RT (e.g., an FFV_O93209 sequence, e.g., SEQ ID NO: 8012), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of an FFV RT further comprising one, two, three, or four mutations selected from the group consisting of D21N, T293N, T419P, and L393K, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an FFV RT further comprising one, two, or three mutations selected from the group consisting of D21N, T293N, and T419P, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an FFV RT further comprising the mutation D21N. In some embodiments, the RT domain comprises the amino acid sequence of an FFV RT further comprising one, two, or three mutations selected from the group consisting of T207N, T333P, and L307K, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an FFV RT further comprising one or two mutations selected from the group consisting of T207N and T333P, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of an FLV RT (e.g., an FLV_P10273 sequence, e.g., SEQ ID NO: 8019), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of an FLV RT further comprising one, two, three, or four mutations selected from the group consisting of D199N, L602W, T305K, and W312F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an FLV RT further comprising one or two

mutations selected from the group consisting of D199N and L602W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a FOAMV RT (e.g., an FOAMV_P14350 sequence, e.g., SEQ ID NO: 8021), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of an FOAMV RT further comprising one, two, three, or four mutations selected from the group consisting of D24N, T296N, S420P, and L396K, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an FOAMV RT further comprising one, two, or three mutations selected from the group consisting of D24N, T296N, and S420P, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an FOAMV RT further comprising the mutation D24N, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an FOAMV RT further comprising one, two, or three mutations selected from the group consisting of T207N, S331P, and L307K, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of an FOAMV RT further comprising one or two mutations selected from the group consisting of T207N and S331P, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a GALV RT (e.g., an GALV_P21414 sequence, e.g., SEQ ID NO: 8027), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a GALV RT further comprising one, two, three, four, or five mutations selected from the group consisting of D198N, E328P, L600W, T304K, and W311F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a GALV RT further comprising one, two, or three mutations selected from the group consisting of D198N, E328P, and L600W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a KORV RT (e.g., an KORV_Q9TTC1 sequence, e.g., SEQ ID NO: 8047), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some

embodiments, the RT domain comprises the amino acid sequence of a GALV RT further comprising one, two, three, four, five, or six mutations selected from the group consisting of D32N, D322N, E452P, L274W, T428K, and W435F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a GALV RT further comprising one, two, three, or four mutations selected from the group consisting of D32N, D322N, E452P, and L274W, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a GALV RT further comprising the mutation D32N. In some embodiments, the RT domain comprises the amino acid sequence of a KORV RT further comprising one, two, three, four, or five mutations selected from the group consisting of D231N, E361P, L633W, T337K, and W344F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a KORV RT further comprising one, two, or three mutations selected from the group consisting of D231N, E361P, and L633W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a MLVAV RT (e.g., an MLVAV_P03356 sequence, e.g., SEQ ID NO: 8053), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a MLVAV RT further comprising one, two, three, four, or five mutations selected from the group consisting of D200N, T330P, L603W, T306K, and W313F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a MLVAV RT further comprising one, two, or three mutations selected from the group consisting of D200N, T330P, and L603W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a MLVBM RT (e.g., an MLVBM_Q7SVK7 sequence, e.g., SEQ ID NO: 8056), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a MLVBM RT further comprising one, two, three, four, or five mutations selected from the group consisting of D199N, T329P, L602W, T305K, and W312F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a MLVBM RT

further comprising one, two, and three mutations selected from the group consisting of D200N, T330P, and L603W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a MLVCB RT (e.g., an MLVCB_P08361 sequence, e.g., SEQ ID NO: 8062), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a MLVCB RT further comprising one, two, three, four, or five mutations selected from the group consisting of D200N, T330P, L603W, T306K, and W313F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a MLVCB RT further comprising one, two, and three mutations selected from the group consisting of D200N, T330P, and L603W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a MLVFF RT, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a MLVFF RT further comprising one, two, three, four, or five mutations selected from the group consisting of D200N, T330P, L603W, T306K, and W313F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a MLVFF RT further comprising one, two, and three mutations selected from the group consisting of D200N, T330P, and L603W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a MLVMS RT (e.g., an MLVMS_reference sequence, e.g., SEQ ID NO: 8137; or an MLVMS_P03355 sequence, e.g., SEQ ID NO: 8070), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a MLVMS RT further comprising one, two, three, four, five, or six mutations selected from the group consisting of D200N, T330P, L603W, T306K, W313F, and H8Y, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a MLVMS RT further comprising one, two, three, four, or five mutations selected from the group consisting of D200N, T330P, L603W, T306K, and W313F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a MLVMS RT

further comprising one, two, or three mutations selected from the group consisting of D200N, T330P, and L603W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a PERV RT (e.g., an PERV_Q4VFZ2 sequence, e.g., SEQ ID NO: 8099), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a PERV RT further comprising one, two, three, four, or five mutations selected from the group consisting of D196N, E326P, L599W, T302K, and W309F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a PERV RT further comprising one, two, or three mutations selected from the group consisting of D196N, E326P, and L599W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a SFV1 RT (e.g., an SFV1_P23074 sequence, e.g., SEQ ID NO: 8105), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a SFV1 RT further comprising one, two, three, or four mutations selected from the group consisting of D24N, T296N, N420P, and L396K, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a SFV1 RT further comprising one, two, or three mutations selected from the group consisting of D24N, T296N, and N420P, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a SFV1 RT further comprising the D24N, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a SFV3L RT (e.g., an SFV3L_P27401 sequence, e.g., SEQ ID NO: 8111), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a SFV3L RT further comprising one, two, three, or four mutations selected from the group consisting of D24N, T296N, N422P, and L396K, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a SFV3L RT further comprising one, two, or three mutations selected from the group consisting of D24N, T296N, and N422P, or a corresponding position in a homologous RT domain. In some embodiments, the

RT domain comprises the amino acid sequence of a SFV3L RT further comprising the mutation D24N, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a SFV3L RT further comprising one, two, or three mutations selected from the group consisting of T307N, N333P, and L307K, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a SFV3L RT further comprising one or two mutations selected from the group consisting of T307N and N333P, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a WMSV RT (e.g., an WMSV_P03359 sequence, e.g., SEQ ID NO: 8131), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a WMSV RT further comprising one, two, three, four, or five mutations selected from the group consisting of D198N, E328P, L600W, T304K, and W311F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a WMSV RT further comprising one, two, or three mutations selected from the group consisting of D198N, E328P, and L600W, or a corresponding position in a homologous RT domain.

In embodiments, the RT domain comprises the amino acid sequence of an RT domain of a XMRV6 RT (e.g., an XMRV6_A1Z651 sequence, e.g., SEQ ID NO: 8134), or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the RT domain comprises the amino acid sequence of a XMRV6 RT further comprising one, two, three, four, or five mutations selected from the group consisting of D200N, T330P, L603W, T306K, and W313F, or a corresponding position in a homologous RT domain. In some embodiments, the RT domain comprises the amino acid sequence of a XMRV6 RT further comprising one, two, or three mutations selected from the group consisting of D200N, T330P, and L603W, or a corresponding position in a homologous RT domain.

In certain embodiments, the RT domain of a gene modifying polypeptide comprises the amino acid sequence of an RT domain of an AVIRE RT, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In embodiments, the RT domain comprises the amino acid sequence of an RT domain comprised in a sequence listed in column 1 of Table A5, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the gene modifying polypeptide further

comprises a linker having at least 99% or 100% identity to SEQ ID NO: 5217 or SEQ ID NO:11,041.

In certain embodiments, the RT domain of a gene modifying polypeptide comprises the amino acid sequence of an RT domain of an MLVMS RT, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In embodiments, the RT domain comprises the amino acid sequence of an RT domain comprised in a sequence listed in any of columns 2-6 of Table A5, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In some embodiments, the gene modifying polypeptide further comprises a linker having at least 99% or 100% identity to SEQ ID NO: 5217 or SEQ ID NO:11,041.

Table A5. Exemplary gene modifying polypeptides comprising an AVIRE RT domain or an MLVMS RT domain.

Systems

In an aspect, the disclosure relates to a system comprising nucleic acid molecule encoding a gene modifying polypeptide (e.g., as described herein) and a template nucleic acid (e.g., a template RNA, e.g., as described herein). In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises one or more silent mutations in

the coding region (e.g., in the sequence encoding the RT domain) relative to a nucleic acid molecule as described herein. In certain embodiments, the system further comprises a gRNA (e.g., a gRNA that binds to a polypeptide that induces a nick, e.g., in the opposite strand of the target DNA bound by the gene modifying polypeptide).

In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide encodes a polypeptide having an amino acid sequence selected from SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide encodes a polypeptide having an amino acid sequence selected from SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide encodes a polypeptide having an amino acid sequence selected from SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide encodes a polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding a portion of an amino acid sequence selected from SEQ ID NOs: 1-7743, wherein the portion comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding a portion of an amino acid sequence selected from SEQ ID NOs: 6001-7743, wherein the portion comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding a portion of an amino acid sequence selected from SEQ ID NOs: 4501-4541, wherein the portion comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding a portion of a polypeptide listed in any of Tables A1, T1, or T2, wherein the portion

comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion.

In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding the linker of an amino acid sequence selected from SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding the linker of a polypeptide having an amino acid sequence selected from SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding the linker of a polypeptide having an amino acid sequence selected from SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding the linker of a polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding the RT domain of an amino acid sequence selected from SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding the RT domain of a polypeptide having an amino acid sequence selected from SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding the RT domain of a polypeptide having an amino acid sequence selected from SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the nucleic acid molecule encoding the gene modifying polypeptide comprises a sequence encoding the RT domain of a polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In an aspect, the disclosure relates to a system comprising a gene modifying polypeptide (e.g., as described herein) and a template nucleic acid (e.g., a template RNA, e.g., as described herein).

In certain embodiments, the gene modifying polypeptide comprises a polypeptide having an amino acid sequence selected from SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises a polypeptide having an amino acid sequence selected from SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises a polypeptide having an amino acid sequence selected from SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises a polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the gene modifying polypeptide comprises a portion of an amino acid sequence selected from SEQ ID NOs: 1-7743, wherein the portion comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion. In certain embodiments, the gene modifying polypeptide comprises a portion of an amino acid sequence selected from SEQ ID NOs: 6001-7743, wherein the portion comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion. In certain embodiments, the gene modifying polypeptide comprises a portion of an amino acid sequence selected from SEQ ID NOs: 4501-4541, wherein the portion comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion. In certain embodiments, the gene modifying polypeptide comprises a portion of a polypeptide listed in any of Tables A1, T1, or T2, wherein the portion comprises a linker and RT domain, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity to said portion.

In certain embodiments, the gene modifying polypeptide comprises the linker of an amino acid sequence selected from SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises a sequence encoding the linker of a polypeptide having

an amino acid sequence selected from SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises a sequence encoding the linker of a polypeptide having an amino acid sequence selected from SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises the linker of a polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

In certain embodiments, the gene modifying polypeptide comprises the RT domain of an amino acid sequence selected from SEQ ID NOs: 1-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises a sequence encoding the RT domain of a polypeptide having an amino acid sequence selected from SEQ ID NOs: 6001-7743, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises a sequence encoding the RT domain of a polypeptide having an amino acid sequence selected from SEQ ID NOs: 4501-4541, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto. In certain embodiments, the gene modifying polypeptide comprises the RT domain of a polypeptide as listed in any of Tables A1, T1, or T2, or an amino acid sequence having at least 70%, 75%, 80%, 85%, 90%, 95%, or 99% identity thereto.

Table A1. Exemplary amino acid sequences for gene modifying polypeptides comprising an RT domain and a linker sequence

SEQ ID NO:	Amino Acid Sequence
