

**METHOD FOR CONSTRUCTING VECTOR PAIR, AND HOST CELL
AND HIGH-EXPRESSION CELL STRAIN**

ABSTRACT

Disclosed in the present application is a method for constructing a vector pair, and a host cell and a high-expression cell strain. The vector pair comprises a first vector and a second vector, the first vector comprises an expression sequence of a first fragment of a bleomycin resistance protein, the second vector comprises an expression sequence of a second fragment of the bleomycin resistance protein, and the first vector and/or the second vector further comprises an expression sequence of a target protein.
