

ABSTRACT OF THE DISCLOSURE

ULTRAFINE BUBBLE-CONTAINING LIQUID PRODUCING APPARATUS AND
ULTRAFINE BUBBLE-CONTAINING LIQUID PRODUCING METHOD

In order to efficiently produce a liquid containing ultrafine bubbles of a desired gas, an ultrafine bubble-containing liquid producing apparatus (2000) includes a gas dissolving unit (800) that dissolves a predetermined gas into a liquid (W), and a UFB generating unit (1000) that generates ultrafine bubbles in the liquid (W) in which the predetermined gas is dissolved. A CPU (2001) performs control under a first condition in a case of causing the gas dissolving unit (800) to operate in a circulation route passing through the dissolving unit (800). The CPU (2001) performs control under a second condition different from the first condition in a case of causing the UFB generating unit (1000) to operate in a circulation route passing through the UFB generating unit (1000).
