

CABLE HEADER CONNECTOR

ABSTRACT

A cable header connector (100) comprises a contact module (122) having a support body (142) and a plurality of cable assemblies (140) held by the support body and arranged in a column. Each of the cable assemblies comprises a contact (146) terminated to a cable (102) and a ground shield (148) coupled to and providing electrical shielding for the contact. The support body has contact channels (180) extending along respective contact channel axes (188) which are parallel to each other, and at least one cable channel (182) intersecting the contact channels. The cables extend through the contact channels and through the at least one cable channel to an outside of the support body, the cables emerging from the support body at corresponding cable exits (150) at respective angles to the contact channel axes.
