Information Processing Apparatus and Method, and Program Storage Medium

ABSTRACT

In an information processor which records many contents or has many contents already recorded therein, and can generate an arbitrary combination of the contents, a weight is computed for each of the contents based on either data stored in a history data file or data stored in a display data file and data stored in a filtering data file, and a content is selected from the contents stored in a content file based on the weight. The selected content is related with a package corresponding to the data stored in the filtering data file.
