# SYSTEM AND METHOD FOR COLLABORATIVE MULTI-DEVICE WEB BROWSING

## ABSTRACT

A collaboration system and method for selectively providing access to portions of Web content for display to users according to levels of access privilege and for directing different portions of the Web content for display at different user-designated devices. A proxy (20) entity is introduced between the Web server (12) and the user locations (10). Documents which are to be presented to multiple users have a policy file that defines multiple privilege groups. Each privilege group has access to a set of different tags. Each user will login into a given group, and will also identify to the proxy (20), via service discovery, all of the devices that the user owns. Given all of this information, the proxy (20) can construct an overall mapping of permitted tags to permitted output devices.
