

ABSTRACT

The present disclosure provides a method and apparatus for detecting associated objects. The method includes: detecting at least one matching object group from an
5 image to be detected, where each of the at least one matching object group includes at least two target objects; acquiring visual information of each of the at least two target objects in each matching object group, and spatial information of the at least two target objects in each matching object group; and determining whether the at least two target
10 information and the spatial information of the at least two target objects in each matching object group. The method according to the present disclosure can improve the detection accuracy of the associated objects.
