

Description**FIELD OF INVENTION**

- 5 This invention relates to the manufacture of porous hollow fibre membranes and more particularly to an extrusion die assembly for forming such membranes.

BACKGROUND ART

- 10 Porous polymeric structures having pores in the range of 0.01 to 10 μm are commonly used for microfiltration. Such membrane structures may be prepared from thermoplastic polymers using precipitation techniques and formed into various shapes including hollow fibres or flat sheets.

- The thermal precipitation technique for membrane formation commences with the formation of a solution of a thermoplastic polymer in a solvent at an elevated temperature. The solution is then cooled and,
15 at a specific temperature which depends on the polymer, the solvent, the concentration of the polymer in the solvent and the rate of cooling, phase separation occurs and the liquid polymer separates from the solvent.

- True solutions require that there be a solvent and a solute. The solvent constitutes a continuous phase, and the solute is distributed randomly in the solvent at a molecular level. Such a situation is almost
20 unknown with polymer solutions. Long polymer chains tend to bend back on themselves and form temporary interactions or bonds with other polymer chains with which they come into contact. These interactions are continually forming and breaking, and new ones are formed. Polymer solutions are thus rarely true solutions but lie somewhere between true solutions and mixtures.

- In many cases it is also difficult to state which is the solvent and which is the solute. In the art, it is
25 accepted practice to call a mixture of polymer and solvent a solution if it is optically clear without obvious inclusions of either phase in the other. Phase separation is usually then taken to be that point where there is an optically detectable separation.

- There is yet another case where the heated mixture of polymer, solvent, and other components if present, is neither a solution nor a mixture in the usual sense of the words. This is the case where a
30 surface-active agent is present in sufficient concentration to form ordered structures such as micelles.

- A hollow fibre forming installation disclosed in US-A-4,708,799 includes a vessel containing a heated solution of a polymer and a liquid which is inert relative to the polymer which is delivered to an extrusion die by a pump. The hollow fibre is extruded through a nozzle into a spinning tube containing inert liquid of the solution. The fibre and the inert liquid pass through an atmospheric gap to a spinning tube in the same
35 direction and at substantially the same linear velocity.

- In that installation, the hollow fibre is extruded in the molten state and formed in the spinning tube. The application of the inert liquid to the molten fibre has an adverse effect on the porosity of the surface of the fibre. Furthermore, the use of a spinning tube is cumbersome and costly.

- US-A-4115492 discloses a process for making a polymeric, porous hollow fibre comprising the steps
40 of:-

- a) heating a mixture of a thermoplastic polymer and a solvent to a temperature and for a time for the polymer and solvent to mutually dissolve,
- b) introducing the molten mixture into an extrusion head adapted to shape the molten mixture into a hollow fibre,
- 45 c) introducing a lumen-forming fluid into the lumen of the shaped molten mixture,
- d) cooling the shaped molten mixture in the extrusion head to a temperature so that non-equilibrium liquid-liquid phase separation takes place to form a bi-continuous matrix of the polymer and solvent in which the polymer and solvent form two intermingled separate phases of large interfacial surface area, and,
- 50 d) removing the solvent from the polymer.

- From one aspect, the present invention provides a process according to Claim 1, in which the precharacterising part of the claim is based on the disclosure of US-A-4115492 and the distinguishing features of the invention are as set out in the characterising part of Claim 1.

- The invention also provided an extrusion head for forming a polymeric, porous hollow fibre and
55 constructed as defined in Claim 19.

- The preferred embodiments of such apparatus comprises. a quadruple co-extrusion head having four concentric passageways. The axial passageway receives a lumen forming fluid, the next outward passageway receives a homogenous mixture of the polymer and a surfactant solvent to form the membrane, the

next outwardly concentric passageway receives a coating fluid and the outermost passageway receives a cold quench fluid.

Each fluid is transported to the extrusion head by means of individual metering pumps. The four fluids are individually heated and are transported along thermally insulated and heat traced pipes. The extrusion head has a number of temperature zones. The lumen fluid, membrane dope and coating fluid are brought to the same temperature in a closely monitored temperature zone where the polymer solution making up the dope is shaped. The quench fluid is introduced in a cooling zone where the dope undergoes non-equilibrium liquid-liquid phase separation to form a bicontinuous matrix of large interfacial surface area of two liquids in which the polymer phase is solidified before aggregated separation into distinct phases of small interfacial surface area can take place.

The hollow fibre membrane leaves the extrusion head completely formed and there is no need for any further formation treatment except for removing the surfactant solvent from the membrane in a post-extrusion operation that is common to membrane manufacturing processes. A volatile solvent that does not dissolve the polymer is used to remove the surfactant solvent for the polymer from the finished membrane.

The hollow fibre membrane made in accordance with the invention is characterised by a lacey or filamentous structure. In this specification, the term "lacey" means that the membrane is made up of a plurality of polymer strands connected together at a number of locations along each strand. Each connection point has only slightly larger dimensions than the cross-section of the strands. The length of each strand is from 5 to 50 times the diameter of the strand and the strands vary in cross-sectional shape from circular to elliptical, in the latter case the major axis of the ellipse may be up to 5 times the minor axis of the ellipse. The description "lacey or filamentous structure" may also be visualized as a three dimensional rounded lace filet derived from a bicontinuous structure.

The hollow fibre membrane may have a lacey structure in which there is some slight orientation of the strands in the axial direction of the fibre so that when a luminal gaseous blowback procedure is implemented to clean the fibres, certain dimensions of the interstices increase on average allowing any material lodged in the interstices to be easily dislodged. The interstices are of a generally axially elongated shape and when the gaseous blowback is applied, the interstices distort from the axially elongated shape into a generally square shape to enlarge the minimum dimension of the interstices. The gaseous blowback will also stretch the fibre to increase the minimum dimension of the interstices.

BRIEF DESCRIPTION OF THE DRAWINGS

In order that the invention may be more readily understood and put into practical effect, reference will now be made to the accompanying drawings in which:-

- Fig.1 is a schematic diagram of an extrusion die according to the invention,
- Fig.2 is a cross-sectional view of an extrusion die assembly according to one embodiment of the invention,
- Fig.3 is an enlarged cross-sectional view of the upper or melt die portion of the extrusion die assembly of Fig. 2, and,
- Fig.4 is an enlarged cross-sectional view of the lower or quench tube portion of the extrusion die shown in Fig. 2,
- Fig. 5 is an enlarged cross-sectional view of the discharge nozzle of the melt die portion of the extrusion die assembly shown in Fig. 2, and,
- Fig. 6 is a schematic diagram of an extrusion installation according to one embodiment of the invention.

The extrusion die shown in schematic form in Fig.1 has, at its upper end, three concentric passageways 11, 12 and 13. The axial passageway 11 carries a lumen fluid 14 such as nitrogen gas, the inner annular passageway 12 carries a homogeneous solution (or dope) 15 of polymer material and surfactant and the outer annular passageway 13 carries a hot coating fluid 16 such as soybean oil. Neither the lumen fluid nor the coating fluid contain the surfactant present in the dope passing through passageway 12. The thick lines in Fig. 1 represent walls and the thin lines represent interfaces between the various fluids.

The upper portion 17 of the extrusion head 10 is a closely monitored temperature zone. Within the hot zone 17, the coating material remains as a coating on the membrane 21 being formed and dissolves part of the surface of the membrane 21 to provide a porous surface on the membrane.

Below the hot zone 14 there is a cooling zone 18 which includes an annular quench fluid passageway 19. The quench fluid, which may be cold soybean oil, is pumped through the quench passageway 19 at a fixed rate and the coolant or quench fluid is not open to atmosphere. The inner wall of quench passageway 19 has a series of openings 20 through which the quench fluid passes. Beneath the extrusion head 10 there

is a collection point for receiving the extruded membrane 21.

An extrusion die assembly 30 according to one embodiment of the invention is shown in Figs. 2 to 5 and consists of an upper or melt die portion 31 and a lower or quench tube die portion 32 coupled together by a union 33.

5 The melt die portion 31 which is shown on an enlarged scale in Fig. 3, has a body 34 having an inlet 35 for receiving membrane forming dope and an inlet 36 for receiving coating fluid. The body has a central bore 37 and at its upper end there is a closure plate 38 having an axial passageway 39 for receiving a lumen forming fluid. The plate 38 is secured to the body 34 by bolts 40 and a seal is provided by "O" ring 41.

10 Within the central bore 37 of the body 34 there is a nozzle member 42 which depends from the plate 38. The axial passageway 39 is reduced in diameter at its lower end where it passes through the tapered end 43 of nozzle member 42. The nozzle member 42 is sealed in the body 34 by "O" ring 44. The passageway 39 corresponds to passageway 11 of Fig. 1.

The dope inlet 35 leads to a dope delivery passageway 45 in communication with an annular chamber 46 formed in the outer surface of nozzle 42. Dope is discharged from the chamber 46 into passageway 47 which exits into a tapered annular fibre forming tube 48 defined between the outer face of the nozzle 42 and a recess 49 formed in die plate 50.

As can be seen in Figs. 3 and 5 the fibre forming tube 48 has an upper conical portion 48a and a lower conical portion 48b. The upper portion 48a is inclined at a larger angle to the vertical than the lower portion 48b. In this instance, the angle of inclination of the upper portion is from 30° to 60° from the axis and that of the lower portion is from 1° to 10° from the axis. In the preferred embodiment, the angle from the axis on the upper portion of nozzle 42 is 44° and on the upper portion of the die plate 50 is 50° and on the lower portion of nozzle 42 is 3° and on the lower portion of ringplate 50 is 5°. The tapered tube 48 provides a neck-down ratio (that is the ratio of the molten dope at the bottom of the tube 48 to diameter of the finished fibre) of 2.1 to 1. The neck down ratio may be in the range of 1:4 to 10:1.

The coating fluid inlet 36 leads to a coating fluid delivery passageway 51 in communication with an annular chamber 52 formed by a recess in the bottom of the body 34 and the die plate 50. Coating fluid is discharged from chamber 52 into passageways 53 formed in the die plate 50 which exit into an annular chamber 54 formed between the bottom of the die plate 50 and ring plate 51.

30 The ring plate 51 is secured to the body 34 by bolt 55. "O" ring 56 provides a seal between the ring plate 51, die plate 50 and body 34 and "O" ring 57 provides a seal between die plate 50 and body 34. A central bore 58 of the stem portion 59 of the ring plate 51 receives the fibre which is retained in hollow form by the lumen fluid and which is coated with the coating fluid.

The quench tube portion 32 which is shown on an enlarged scale in Fig. 4 has a body portion 60 and a connector plate 61 secured thereto by bolt 62. "O" ring 63 provides a seal between the body 60 and plate 61. The body 60 has a quench fluid inlet 64 which leads to a quench fluid chamber 65 formed by a recess 66 formed in the body 60.

Within the recess 66 there is a quench oil diffuser 67 having an axial bore 68. Passageways 69 connect the chamber 65 to the bore 68.

40 "O" ring 70 seals the diffuser 67 with respect to the body 60 and "O" ring 71 seals the diffusion 67 with respect to the connector plate 61. The bore 68 of the diffuser 67 is in communication with the bore 72 of body 60 which in turn is in communication with the bore 73 of discharge tube 74.

Fig. 5 is an enlarged view of the discharge nozzle 42 which, in this instance, is modified to be in the nature of a needle 80 having a plurality of protrusions 81 which act to self centre the needle 80 within the chamber 48.

45 The extrusion line shown in Fig. 6 includes a vessel 90 containing a membrane forming solution or dope. Around the vessel 90 there is a heating jacket 91 coupled to a heating oil system (not shown) by lines 92 and 93. Dope from the vessel 90 is drawn through line 94 and valve 95 by gear pump 96. From the gear pump 96, the dope passes through filter 97 having a heating jacket 98 coupled to the heating oil system by lines 99 and 100.

Downstream of the filter 97, dope line 94 branches into four lines 94a, 94b, 94c and 94d which lead to extrusion die heads 101, 102, 103 and 104 respectively. Each die head has a melt portion 105 of the kind described in relation to Fig. 3 and a quench tube portion 106 of the kind described in relation to Fig. 4. Lines 107 represent the formed hollow fibres which are extruded from the die heads 101, 102, 103 and 104.

55 The hollow fibres are wound onto reels (not shown).

A vessel 108 containing a quench fluid has a heating jacket 109 coupled to the oil heating system by lines 110 and 111. Quench fluid is drawn through line 112 and valve 113 by gear pump 114. Downstream of the pump 114, the line 112 branches into four lines 112a, 112b, 112c and 112d which lead to the respective

quench tube portions 106 of the die heads 101, 102, 103 and 104. After passing through the tube portions 106 the quench fluid is collected in reservoir 117 and returned to vessel 108 through line 118.

A lumen forming fluid is introduced through line 119 and returned to vessel 108 through line 118. 119 branches into line 121, 122, 123 and 124 which lead to the respective melt portions 105 of the die heads 101, 102, 103 and 104.

The various pipes of the installation are insulated and all parameters are controlled by a microprocessor.

DESCRIPTION OF PREFERRED EMBODIMENTS

The invention will now be further described with reference to the production of porous hollow fibre membranes.

EXAMPLE 1

A dope was formed by mixing and then heating 2600 gram of polypropylene pellets, 7300 gram of TERIC N2 and 100 gram of anti-oxidant ETHANOX 330 (ETHANOX & TERIC are Registered Trade Marks). TERIC N2 is nonylphenoxyethoxyethanol. The temperature of the dope was raised to above 220 °C with agitation under vacuum to ensure that the mixture became homogeneous. The dope was then extruded through the quadruple passage die at a temperature of 220 °C.

During mixing, the vessel 90 was held under a vacuum of -96kPa and the oil heating system maintained at 245 °C. Mixing was commenced when the temperature of the vessel 90 was 160 °C. The mixing and heating time was 240 minutes. During extrusion the lumen forming nitrogen gas was maintained at 200 kPa. The filter 97 had an average pore diameter of 20 µm and the pressure drop across the filter was 50 kPa.

Nitrogen was used as the lumen forming fluid and soybean oil as the coating fluid and quenching fluid. The dope flow rate was 22cc/min, the lumen pump flow rate 7.6 cc/min, the coating pump flow rate 5.0 cc/min and the quench pump flow rate was 1750 cc/min.

The circularity of the fibre prior to extraction of the solvent was 95% and the break extension was 175%. After extracting the solvent, the physical characteristics of the fibre were:-

Lumen	340 µm
Outer diameter	640 µm
Circularity	
Concentricity	
Bubble Point	>170kPa
% pores above 0.16 micron	> 50%
Mean pore size	0.20 µm
Water Permeability at 50 kPa	> 40 cc/min/m
Yield force	0.8 N
Break force	1.0 N
Break extension	> 150%
Surface pore width (nominal)	1 µm

The structure of the fibre so formed was generally lacey. The lacey structure does not lend itself to a precise qualitative description in terms used to describe prior art membranes such as cells and pores. In the prior art such as U.S. patent 4,519,909, cells relate to spheres and pores relate to cylinders. In some respects, the parts of the lacey structure where one cavity intersects another may be equivalent to a "cell" and the actual intersection itself a "pore". Topologically, such "cells" of the lacey structure relate to adjacent spheres and such "pores" relate to circles formed by their intersection whereas in the prior art the cells relate to separated spheres and the pores relate to the connecting cylinders.

As well as such "pores" and "cells", the lacey structure has alveoli which are larger cavities than cells and these connect to a larger number of "cells". The lacey structure occupies the spaces between the alveoli.

A typical lacey structure may have substantially spherical "cells" of between 0.1 to 5 µm which have substantially circular "pores" of 0.1 to 0.5 micron interconnecting the cells to each other. The "pores" also connect the cells to alveoli of about 8 to 20 µm. Water Permeability tests showed that the permeability of a typical fibre from outside to lumen was one third of the permeability from lumen to outside.

Although the example has been described in relation to a polypropylene/TERIC N2 solution, it is to be understood that the extrusion process may be applied to other solutions. Soybean oil with or without castor oil may be added to the solution as a co-solvent and SYNPROLAM 35X2 or BRIJ 92 may be used instead of TERIC N2. SYNPROLAM and BRIJ are Registered Trade Marks. A solvent may be added to the coating fluid.

Surface pore modification may be effected by both temperature control and variation of the composition of the coating fluid. Membranes can be prepared having elongated pores in the axial direction but with symmetrical morphology in the radial and circumferential directions. Surface porosity can be varied in radial porosity from a "skin" through to complete radial isotropy and further to having a surface that is more porous than the remainder of the membrane (reverse asymmetry).

During extrusion, the coating fluid mixes significantly with the molten polymer to a greater extent than the quench fluid mixes when the coating fluid is omitted. The coating fluid controls the surface porosity of the membrane. The hot coating fluid ameliorates the sudden cooling effect of the quench fluid on the dope. The coating fluid is a separate, co-extrusion, and is neither part of the membrane extrusion nor the quench co-extrusion.

Although the precise mechanism of the structure formation is not clear, it would seem that a liquid-liquid bicontinuous system is formed which if maintained for sufficient time would become two separate layers. During this process, the system could be made to pass through a lacey structure followed by a stage of nearly spherical cells with interconnecting pores. For a given polymer and solvent mix, the size range of the cells depends on cooling rate and the interfacial surface tension between the polymer rich and the polymer lean phases while the pore size depends on cooling rate and, to a lesser extent, molecular weight of the polymer.

It is to be noted that the fibre travels down the quench tube at a significantly different linear speed from the quench fluid. The extruded fibre travels at a speed three to four times faster than the average speed of the quench fluid. Such a speed difference calculated on the average speed also means that the fibre travels at a speed about double the maximum speed of the quench fluid. The average and maximum speed of the quench fluid above are taken as the speed with no fibre present.

Although the above example refers to the use of nitrogen as the lumen forming fluid, any saturated vapour may be used as may a wide variety of liquids. When nitrogen (or a saturated vapour) is used, it has the effect of reducing the luminal surface pore size, giving greater asymmetry. Use of a saturated vapour has the property that it will condense in the lumen under cooling, allowing the quench fluid to pass through the porous walls, and give some measure of mechanical compression to the solidifying membrane.

Although polypropylene is the presently preferred thermoplastic polymer, the following polymers may be used:-

- (a) polybutylene
- (b) polyvinylidene difluoride
- (c) polyvinylidene dichloride
- (d) polyamide
- (e) polyvinyl chloride
- (f) polystyrene
- (g) polymethylmethacrylate
- (h) polyphenylene oxide
- (i) polyethylene terephthalate
- (j) polyacrylonitrile
- (k) cellulose acetate

Apart from TERIC N2 another solvent for polyolefins which may be used is SYNPROLAM 35X2 which is an amine ethoxylate of the general formula:-

where $x + y = 2$ to 50 and R is a mixture of C_{13} and C_{15} fatty radicals in the approximate ratio of 70:30 about half of which are linear and the rest mostly branched species. In the case of SYNPROLAM 35X2, $x + y = 2$. Yet another solvent which may be used is BR1J 92 which is a polyoxyethylene (2) oleyl alcohol. Other solvents for polyolefins which may be used in carrying out the process of the invention include:-

- 5 (a) ethyloxylated derivatives of cetyl-oleyl alcohol such as TERIC 17A2
- (b) condensates of ethylene oxide with tall oil such as TERIC T2
- (c) self-emulsifying derivatives from high molecular weight fatty acids such as TERIC124
- (d) sorbitan monooleate
- (e) sorbitan monostearate
- 10 (h) POE cetyl oleyl alcohol such as ATLAS G-70140
- (i) ATMER 685 nonionic surfactant
- (j) POE (2) cetyl alcohol
- (k) POE (2) stearyl alcohol
- (l) POE fatty alcohols such as CIRRASOL EN-MB and CIRRASOL EN-MP
- 15 (m) POE (2) synthetic primary C_{13}/C_{15} alcohol such as RENEX 702

ATLAS, ATMER, CIRRASOL and RENEX are Registered Trade Marks.

The same substance may be used as the coating, lumen, or quench fluids. The lumen forming fluid may be selected from a wide variety of substances such as soybean oil or an inert gas such as nitrogen. Water may be used as the quench fluid. Other substances which may be used as the lumen forming fluid,

20 the coating fluid and the quenching fluid include:-

- (a) paraffin oil
- (b) peanut oil
- (c) teal oil
- (d) boleko oil
- 25 (e) oil of mustard
- (f) olive oil
- (g) seneca oil
- (h) coconut oil
- (i) coffee oil
- 30 (j) rapeseed oil
- (k) corn oil
- (l) cottonseed oil
- (m) glycerol
- (n) glyceryl trioleate
- 35 (o) trimyristin
- (p) jojoba oil
- (q) macassar oil
- (r) neem oil
- (s) castor oil
- 40 (t) orris root oil
- (u) safflower oil
- (v) oleic, palmitic, stearic, arachidic, arachidonic, behenic, lignoceric, linoleic, linolenic, elaidic, vaccenic acids and their glycerides, and mixed with their sodium, potassium and calcium salts
- (w) dioctylphthalate and other phthalate esters of alcohols of six carbon atoms or more

45 EXAMPLE 2

5.2 kg Hoechst polypropylene PPN1060F was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 230°C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 31.3°C.

The dimensions of the fibre were 322 µm lumen diameter and 671 µm outside diameter.

The resulting fibre had a water permeability of 106 ml/min/m at 96 kPa, 367 ml/min/m at 398 kPa, and 478 ml/min/m at 599 kPa, a mean pore size of 0.301 micron and 90.7% pores above 0.16 µm.

55 EXAMPLE 3

5.2 kg Hoechst polypropylene PPN1060F was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 230°C with soybean oil as the lumen, coating and quench

fluids. The quench fluid temperature was 29.9 °C.

The dimensions of the fibre were 324 micron lumen diameter and 652 micron outside diameter.

The resulting fibre had a water permeability of 126 cm³/min/m at 96 kPa, 430 cm³/min/m at 398 kPa, and 543 cm³/min/m at 599 kPa, a mean pore size of 0.380 µm and 95.2% pores above 0.16 µm.

5

EXAMPLE 4

5.2 kg Hoechst polypropylene PPN1060F was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 230 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 31.7 °C.

10

The dimensions of the fibre were 323 µm lumen diameter and 640 µm outside diameter.

The resulting fibre had a water permeability of 94 cm³/min/m at 95 kPa, 330 cm³/min/m at 396 kPa, and 448 cm³/min/m at 598 kPa, a mean pore size of 0.310 µm and 87.9% pores above 0.16 µm.

15

EXAMPLE 5

5.2 kg Hoechst polypropylene PPN1060F was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and Extruded at a temperature of 230 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 31.8 °C.

20

The dimensions of the fibre were 320 µm lumen diameter and 627 µm outside diameter.

The resulting fibre as a water permeability of 80 cm³/min/m at 98 kPa, 288 cm³/min/m at 399 kPa, and 393 cm³/min/m at 600 kPa, a mean pore size of 0.260 µm and 80.9% pores above 0.16 µm.

EXAMPLE 6

25

5.2 kg Hoechst polypropylene PPN1060F was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 230 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 30.5 °C.

The dimensions of the fibre were 325 µm lumen diameter and 642 µm outside diameter.

30

The resulting fibre had a water permeability of 73 cm³/min/m at 98 kPa, 288 cm³/min/m at 399 kPa, and 393 cm³/min/m at 600 kPa, a mean pore size of 0.260 µm and 80.9% pores above 0.16 µm.

EXAMPLE 7

35

6.75 kg Hoechst polypropylene PPN1060F was dissolved in 18.25 kg TERIC N2 with 0.25 kg antioxidant Ethanox 330 and extruded at a temperature of 230 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 30.1 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

40

The resulting fibre had a water permeability of 68 cm³/min/m at 95 kPa, 288 cm³/min/m at 402 kPa, and 347 cm³/min/m at 600 kPa, a mean pore size of 0.270 µm and 80.1% pores above 0.16 µm.

EXAMPLE 8

45

5.2 kg Hoechst polypropylene PPN1060F was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 230 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 31.5 °C.

The dimensions of the fibre were 310 micron lumen diameter and 599 micron outside diameter.

The resulting fibre had a water permeability of 52 cm³/min/m at 96 kPa, 241 cm³/min/m at 397 kPa, and 305 cm³/min/m at 598 kPa, a mean pore size of 0.322 µm and 65.7% pores above 0.16 µm.

50

EXAMPLE 9

55

5.2 kg Shell polypropylene LY6100 was dissolved in a mixture of 9.8 kg soybean oil and 4.6 kg castor oil with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 195 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 26.2 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 175 kPa, a mean pore size of 0.3 µm and 87.4% pores above 0.16 µm.

EXAMPLE 10

5.2 kg Hoechst polypropylene PPR1070 was dissolved in a mixture of 9.8 kg soybean oil and 4.6 kg castor oil with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 197 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 26.0 °C.

The nominal dimensions of the fibre were 320 micron lumen diameter and 650 micron outside diameter.

The resulting fibre had a bubble point of 133 kPa, a mean pore size of 0.45 micron and 100.0% pores above 0.16 micron.

EXAMPLE 11

5.2 kg Hoechst polypropylene PPR1060F was dissolved in a mixture of 10.8 kg soybean oil and 5.0 kg castor oil and extruded at a temperature of 186 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 27.5 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 245 kPa, a mean pore size of 0.19 µm and 86.2% pores above 0.16 µm.

EXAMPLE 12

5.2 kg Hoechst polypropylene PPN1070 was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 196 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 25.4 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 140 kPa, a mean pore size of 0.24 µm and 89.6% pores above 0.16 µm.

EXAMPLE 13

4.8 kg Hoechst polypropylene PPN1070 was dissolved in 15.0 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 198 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 20.7 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 175 kPa, a mean pore size of 0.23 µm and 82.8% pores above 0.16 µm.

EXAMPLE 14

5.2 kg Hoechst polypropylene PPN1060F was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 238 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 21.4 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 280 kPa, a mean pore size of 0.18 µm and 83.4% pores above 0.16 µm.

Claims

1. A process for making a polymeric, porous hollow fibre comprising the steps of:-

- a) heating a mixture (15) of a thermoplastic polymer and a solvent to a temperature and for a time for the polymer and solvent to mutually dissolve,
- b) introducing the molten mixture (15) into an extrusion head adapted to shape the molten mixture into a hollow fibre,
- c) introducing a lumen-forming fluid (14) into the lumen of the shaped molten mixture,
- d) cooling the shaped molten mixture in the extrusion head to a temperature so that non-equilibrium liquid-liquid phase separation takes place to form a bicontinuous matrix of the polymer and solvent in which the polymer and solvent form two intermingled separate phases of large interfacial surface area, and,

**EXAMPLE 10**

5.2 kg Hoechst polypropylene PPR1070 was dissolved in a mixture of 9.8 kg soybean oil and 4.6 kg castor oil with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 197 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 26.0 °C.

The nominal dimensions of the fibre were 320 micron lumen diameter and 650 micron outside diameter.

The resulting fibre had a bubble point of 133 kPa, a mean pore size of 0.45 micron and 100.0% pores above 0.16 micron.

EXAMPLE 11

5.2 kg Hoechst polypropylene PPR1060F was dissolved in a mixture of 10.8 kg soybean oil and 5.0 kg castor oil and extruded at a temperature of 186 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 27.5 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 245 kPa, a mean pore size of 0.19 µm and 86.2% pores above 0.16 µm.

EXAMPLE 12

5.2 kg Hoechst polypropylene PPN1070 was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 196 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 25.4 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 140 kPa, a mean pore size of 0.24 µm and 89.6% pores above 0.16 µm.

EXAMPLE 13

4.8 kg Hoechst polypropylene PPN1070 was dissolved in 15.0 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 198 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 20.7 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 175 kPa, a mean pore size of 0.23 µm and 82.8% pores above 0.16 µm.

EXAMPLE 14

5.2 kg Hoechst polypropylene PPN1060F was dissolved in 14.6 kg TERIC N2 with 0.2 kg antioxidant Ethanox 330 and extruded at a temperature of 238 °C with soybean oil as the lumen, coating and quench fluids. The quench fluid temperature was 21.4 °C.

The nominal dimensions of the fibre were 320 µm lumen diameter and 650 µm outside diameter.

The resulting fibre had a bubble point of 280 kPa, a mean pore size of 0.18 µm and 83.4% pores above 0.16 µm.

Claims

1. A process for making a polymeric, porous hollow fibre comprising the steps of:-

a) heating a mixture (15) of a thermoplastic polymer and a solvent to a temperature and for a time for the polymer and solvent to mutually dissolve,

b) introducing the molten mixture (15) into an extrusion head adapted to shape the molten mixture into a hollow fibre,

c) introducing a lumen-forming fluid (14) into the lumen of the shaped molten mixture,

d) cooling the shaped molten mixture in the extrusion head to a temperature so that non-equilibrium liquid-liquid phase separation takes place to form a bicontinuous matrix of the polymer and solvent in which the polymer and solvent form two intermingled separate phases of large interfacial surface area, and,

e) removing the solvent from the polymer,
characterised by:

(f) introducing a coating fluid (16) around the outer surface of the shaped molten mixture, and
(g) introducing a cooling fluid around the coating fluid.

5

2. A process according to claim 1 wherein the extrusion head has a first temperature zone (17, 31) in which the fibre is formed and a second temperature zone (18, 32) in which the formed fibre is cooled and solidified.

10

3. A process according to claim 2 wherein the lumen-forming fluid (14) and the coating fluid (16) are introduced into the extrusion head at the first temperature zone (17, 31) and the cooling fluid is introduced into the extrusion head at the second temperature zone (18, 32).

15

4. A process according to any one of the preceding claims wherein the diameter of the fibre is reduced after formation of the hollow fibre form, the ratio of the final diameter of the fibre to that of the initial diameter being in the range of from 0.25 to 10.

20

5. A process according to any one of the preceding claims wherein the fibre travels through the extrusion head at a different linear speed to that of the cooling fluid.

6. A process according to claim 5 wherein the fibre travels at a speed 3 to 4 times faster than the average speed of the cooling fluid.

25

7. A process according to any one of the preceding claims wherein the lumen forming fluid (14) is nitrogen gas or a saturated vapour.

30

8. A process according to any one of the preceding claims wherein the coating fluid (16) is selected from the group comprising soybean oil, paraffin oil, peanut oil, teel oil, boleko oil, oil of mustard, olive oil, seneca oil, coconut oil, coffee oil, rapeseed oil, corn oil, cottonseed oil, glycerol, glyceryl trioleate, trimyristin, jojoba oil, macassar oil, neem oil, castor oil, orris root oil, and safflower oil and oleic, palmitic, stearic, arachidic, arachidonic, behenic, lignoceric, linoleic, linolenic, elaidic, vaccenic acids and their glycerides, and mixed with their sodium, potassium and calcium salts.

35

9. A process according to any one of the preceding claims where the cooling fluid is selected from the group comprising soybean oil, water, paraffin oil, peanut oil, teel oil, boleko oil, oil of mustard, olive oil, seneca oil, coconut oil, coffee oil, rapeseed oil, corn oil, cottonseed oil, glycerol, glyceryl trioleate, trimyristin, jojoba oil, macassar oil, neem oil, castor oil, orris root oil, and safflower oil and oleic, palmitic, stearic, arachidic, arachidonic, behenic, lignoceric, linoleic, linolenic, elaidic, vaccenic acids and their glycerides, and mixed with their sodium, potassium and calcium salts.

40

10. A process according to claim 9 wherein the cooling fluid is the same as the coating fluid (16).

45

11. A process according to claim 10 wherein the lumen-forming fluid (14) is the same as the coating fluid (16) and the cooling fluid.

12. A process according to claim 3 wherein the lumen-forming fluid (14) and the coating fluid (16) are heated to the temperature of the molten mixture (15) before being introduced into the extrusion head.

50

13. A process according to any one of the preceding claims wherein the polymer is selected from the group comprising polypropylene, polybutylene, polyvinylidene difluoride, polyvinylidene dichloride, polyamide, polyvinyl chloride, polystyrene, polymethylmethacrylate, polyphenylene oxide, polyethylene terephthalate, polyacrylonitrile and cellulose acetate.

55

14. A process according to any one of the preceding claims wherein the solvent is selected from the group comprising cationic, anionic and non-ionic surfactants.

15. A process according to any one of the preceding claims wherein the fibre forming mixture includes an anti-oxidant.

16. A process according to claim 15 wherein the antioxidant is selected from the group comprising (1,3,5-trimethyl-2,4,6-tris-3,5-di-tert-butyl-4-hydroxybenzyl)benzene and a dissolvable hindered phenol.
17. An extrusion head for forming a polymeric, porous hollow fibre comprising an elongated body defining an axial passageway (11, 39) for receiving a lumen-forming fluid (14), a first annular passageway (12, 48) around the axial passageway for receiving a molten mixture (15) from which the hollow fibre is formed, a second annular passageway (13, 53) radially outward of the first annular passageway (12, 48) for receiving a coating fluid (16) and a third annular passageway (19) for receiving a cooling fluid and means (20) for directing the cooling fluid towards the outer surface of the coating fluid.
18. An extrusion head according to claim 17 wherein the axial passageway (11, 39), the first annular passageway (12, 48) and the second annular passageway (13, 53) are located in a first portion (31) of the extrusion head and the third annular passageway (19) is located in a second portion (32) of the extrusion head.
19. An extrusion head according to claim 18 wherein the extrusion head has a passageway (68) connecting the first and second portions (31, 32) and the third annular passageway (53) is radially outward of the connecting passageway (68) with the directing means (69) therebetween.
20. An extrusion head according to claim 17 wherein the axial passageway (39) terminates in a nozzle (80) that projects into the first annular passageway (48).
21. An extrusion head according to claim 20 wherein the nozzle (80) has a plurality of protrusions (81) around its outer periphery for centering the nozzle with respect to the first annular passageway (48).
22. An extrusion head according to claim 17 wherein the first annular passageway (48) is inwardly tapered towards the axis of the extrusion head.
23. An extrusion head according to claim 22 wherein the first passageway (48) has a first tapered portion (48a) and a second tapered portion (48b) with the first tapered portion being at a greater angle to the axis than the second tapered portion.
24. An extrusion head according to claim 17 wherein the axial passageway (39) and the first annular passageway (48) terminate at the same position within the extrusion head.
25. An extrusion head according to any preceding claim, wherein the second annular passageway has a first portion (53) of constant cross-section and a second portion (54) that is tapered towards the axis of the axial passageway.
26. An extrusion head according to any preceding claim wherein the directing means comprises an elongated annular member (67) having a tapered bore (68), the taper increasing outwardly relative to the direction of fibre flow through the extrusion head.
27. A hollow fibre forming installation comprising:-
 - (i) a vessel (90) for containing a molten mixture from which the fibre is formed,
 - (ii) an extrusion head according to any one of claims 17 to 26,
 - (iii) means (96, 94) for transporting the molten mixture to the extrusion head,
 - (iv) means (119, 39) for supplying lumen-forming fluid to the extrusion head,
 - (v) means (36) for supplying fibre coating fluid to the extrusion head,
 - (vi) means (114, 112) for supplying cooling liquid to the extrusion head, and,
 - (vii) means (91) for heating the molten mixture, the lumen-forming fluid and the coating fluid to substantially the same temperature.
28. An installation according to claim 27 and including a filter (98) between the vessel (90) and the extrusion head.
29. An installation according to claim 27 or 28 and including four extrusion heads.

Patentansprüche

1. Verfahren zur Herstellung einer polymeren, porösen Hohlfaser in folgenden Schritten:
 - a) ausreichend langes Erwärmen eines Gemischs (15) aus einem thermoplastischen Polymeren und einem Lösungsmittel auf eine ausreichende Temperatur, um eine wechselseitige Lösung des Polymeren und Lösungsmittels herbeizuführen;
 - b) Einführen des erschmolzenen Gemischs (15) in einen für das Ausformen des erschmolzenen Gemischs zu einer Hohlfaser ausgelegten Spritzkopf;
 - c) Einführen eines lumenbildenden Fluidums (14) in den Hohlraum des ausgeformten erschmolzenen Gemischs;
 - d) Kühlen des ausgeformten erschmolzenen Gemischs im Spritzkopf auf eine solche Temperatur, bei der eine Nicht-Gleichgewicht-Flüssig/Flüssig-Phasentrennung unter Bildung einer bikontinuierlichen Matrix des Polymeren und Lösungsmittels, in der das Polymere und das Lösungsmittel zwei miteinander vermischte getrennte Phasen großer Grenzflächen bilden, stattfindet;
 - e) Entfernen des Lösungsmittels aus dem Polymeren, gekennzeichnet durch
 - f) Einführen eines Beschichtungsfluidums (16) um die Außenfläche des ausgeformten erschmolzenen Gemischs herum und
 - g) Einführen eines Kühlfluidums um das Beschichtungsfluidum herum.
2. Verfahren nach Anspruch 1, wobei der Spritzkopf eine erste Temperaturzone (17, 31), in der die Faser gebildet wird, und eine zweite Temperaturzone (18, 32), in der die gebildete Faser gekühlt und verfestigt wird, aufweist.
3. Verfahren nach Anspruch 2, wobei das lumenbildende Fluidum (14) und das Beschichtungsfluidum (16) in den Spritzkopf an der ersten Temperaturzone (17, 31) und das Kühlfluidum in den Spritzkopf an der zweiten Temperaturzone (18, 32) eingeführt werden.
4. Verfahren nach einem der vorhergehenden Ansprüche, wobei der Faserdurchmesser nach Ausbildung der Hohlfaserform derart vermindert wird, daß das Verhältnis Durchmesser der Faser / Anfangsdurchmesser im Bereich von 0,25 bis 10 liegt.
5. Verfahren nach einem der vorhergehenden Ansprüche, wobei die Faser durch den Spritzkopf mit einer von der Lineargeschwindigkeit des Kühlfluidums verschiedenen Lineargeschwindigkeit wandert.
6. Verfahren nach Anspruch 5, wobei die Faser mit einer im Vergleich zur Durchschnittsgeschwindigkeit des Kühlfluidums 3 bis 4 mal schnelleren Geschwindigkeit wandert.
7. Verfahren nach einem der vorhergehenden Ansprüche, wobei das lumenbildende Fluidum (14) aus gasförmigem Stickstoff oder einem Sattendampf besteht.
8. Verfahren nach einem der vorhergehenden Ansprüche, wobei das Beschichtungsfluidum (16) aus der Gruppe Sojabohnenöl, Paraffinöl, Erdnußöl, Sesamöl, Bolekoöl, Senföl, Olivenöl, Senecaöl, Kokosnußöl, Kaffeeöl, Rapssaatöl, Maisöl, Baumwollsaatöl, Glycerin, Glyzeryltriöleat, Trimyristin, Jojobaöl, Macassaröl, Nimöl, Rizinußöl, Iriswurzelöl und Saffloröl sowie Öl-, Palmitin-, Stearin-, Arachin-, Arachidon-, Behen-, Lignocerin-, Linol-, Linolen-, Elaidin- und Vaccensäuren sowie deren Glyzeriden und gemischt mit ihren Natrium-, Kalium- und Kalziumsalzen ausgewählt ist.
9. Verfahren nach einem der vorhergehenden Ansprüche, wobei das Kühlfluidum aus Sojabohnenöl, Wasser Paraffinöl, Erdnußöl, Sesamöl, Bolekoöl, Senföl, Olivenöl, Senecaöl, Kokosnußöl, Kaffeeöl, Rapssaatöl, Maisöl, Baumwollsaatöl, Glycerin, Glyzeryltriöleat, Trimyristin, Jojobaöl, Macassaröl, Nimöl, Rizinußöl, Iriswurzelöl und Saffloröl sowie Öl-, Palmitin-, Stearin-, Arachin-, Arachidon-, Behen-, Lignocerin-, Linol-, Linolen-, Elaidin- und Vaccensäuren sowie deren Glyzeriden und gemischt mit ihren Natrium-, Kalium- und Kalziumsalzen ausgewählt ist.
10. Verfahren nach Anspruch 9, wobei das Kühlfluidum dasselbe ist wie das Beschichtungsfluidum (16).

11. Verfahren nach Anspruch 10, wobei das lumenbildende Fluidum (14) dasselbe ist wie das Beschichtungsfluidum (16) und das Kühlfluidum.
- 5 12. Verfahren nach Anspruch 3, wobei das lumenbildende Fluidum (14) und das Beschichtungsfluidum (16) vor ihrer Einführung in den Spritzkopf auf die Temperatur des erschmolzenen Gemischs (15) erwärmt werden.
- 10 13. Verfahren nach einem der vorhergehenden Ansprüche, wobei das Polymere aus der Gruppe Polypropylen, Polybutylen, Polyvinylidendifluorid, Polyvinylidendichlorid, Polyamid, Polyvinylchlorid, Polystyrol, Polymethylmethacrylat, Polyphenylenoxid, Polyethylenterephthalat, Polyacrylnitril und Celluloseacetat ausgewählt ist.
- 15 14. Verfahren nach einem der vorhergehenden Ansprüche, wobei das Lösungsmittel aus der Gruppe kationische, anionische und nicht-ionische oberflächenaktive Mittel bzw. Netzmittel ausgewählt ist.
- 20 15. Verfahren nach einem der vorhergehenden Ansprüche, wobei das faserbildende Gemisch ein Antioxidationsmittel enthält.
- 25 16. Verfahren nach Anspruch 15, wobei das Antioxidationsmittel aus der Gruppe (1,3,5-Trimethyl-2,4,6-tris-3,5-di-tert.-butyl-4-hydroxybenzyl)benzol und einem löslichen gehinderten Phenol ausgewählt ist.
- 30 17. Spritzkopf zum Formen einer polymeren, porösen Hohlaser, umfassend einen langgestreckten Körper, der einen axialen Durchgang (11, 39) zum Aufnehmen eines lumenbildenden Fluidums (14), einen um den axialen Durchgang herum angeordneten ersten ringförmigen Durchgang (12, 48) zum Aufnehmen eines aufgeschmolzenen Gemisches (15) aus dem die Hohlaser geformt wird, einen radial auswärts vom ersten ringförmigen Durchgang (12, 48) gelegenen zweiten ringförmigen Durchgang (13, 53) zum Aufnehmen eines Beschichtungsfluidums (16) und einen dritten ringförmigen Durchgang (19) zum Aufnehmen eines Kühlfluidums festlegt, sowie ein Mittel (20) zum Richten des Kühlfluidums in Richtung auf die Außenfläche des Beschichtungsfluidums.
- 35 18. Spritzkopf nach Anspruch 17, wobei der axiale Durchgang (11, 39), der erste ringförmige Durchgang (12, 48) und der zweite ringförmige Durchgang (13, 53) in einem ersten Abschnitt (31) des Spritzkopfes angeordnet sind und der dritte ringförmige Durchgang (19) in einem zweiten Abschnitt (32) des Spritzkopfes angeordnet ist.
- 40 19. Spritzkopf nach Anspruch 18, wobei der Spritzkopf einen die ersten und zweiten Abschnitte (31, 32) verbindenden Durchgang (68) aufweist und der dritte ringförmige Durchgang (53) mit dazwischen liegendem Richtmittel (69) radial auswärts vom verbindenden Durchgang (68) angeordnet ist.
- 45 20. Spritzkopf nach Anspruch 17, wobei der axiale Durchgang (39) in einer Düse (80) ausläuft, die in den ersten ringförmigen Durchgang (48) hineinragt.
21. Spritzkopf nach Anspruch 20, wobei die Düse (80) um ihren Außenumfang herum eine Anzahl von Vorsprüngen (81) zum Zentrieren der Düse gegenüber dem ersten ringförmigen Durchgang (48) aufweist.
22. Spritzkopf nach Anspruch 17, wobei der erste ringförmige Durchgang (48) in Richtung auf die Achse des Spritzkopfes einwärts verjüngt bzw. konisch geformt ist.
- 50 23. Spritzkopf nach Anspruch 22, wobei der erste Durchgang (48) einen ersten sich verjüngenden bzw. konischen Abschnitt (48a) und einen zweiten sich verjüngenden bzw. konischen Abschnitt (48b) aufweist, von denen der erste konische Abschnitt unter einem größeren Winkel zur Achse angeordnet ist als der zweite konische Abschnitt.
- 55 24. Spritzkopf nach Anspruch 17, wobei der axiale Durchgang (39) und der erste ringförmige Durchgang (48) an der gleichen Stelle innerhalb des Spritzkopfes enden.

25. Spritzkopf nach einem der vorangehenden Ansprüche, wobei der zweite ringförmige Durchgang einen ersten Abschnitt (53) konstanten Querschnitts und einen zweiten Abschnitt (54), der in Richtung auf die Achse des axialen Durchgangs verjüngt bzw. konisch geformt ist, aufweist.
- 5 26. Spritzkopf nach einem der vorangehenden Ansprüche, wobei das Richtmittel ein langgestrecktes ringförmiges Element (67) mit einer sich verjüngenden bzw. konischen Bohrung (68) aufweist, wobei die Verjüngung bzw. Konizität in Auswärtsrichtung relativ zur Richtung des Faserflusses durch den Spritzkopf zunimmt.
- 10 27. Hohlfaserformanlage, umfassend:
- (1) ein Gefäß (90) zum Aufnehmen eines aufgeschmolzenen Gemisches, aus dem die (Hohl-)Faser geformt wird,
 - (2) einen Spritzkopf nach einem der Ansprüche 17 bis 26,
 - (3) Einrichtungen (96, 94) zum Transportieren des aufgeschmolzenen Gemisches zum Spritzkopf,
 - 15 (4) Einrichtungen (119, 39) zum Zuführen eines lumenbildenden Fluidums zum Spritzkopf,
 - (5) eine Einrichtung (36) zum Zuführen eines Faser-Beschichtungsfluidums zum Spritzkopf,
 - (6) eine Einrichtung (114, 112) zum Zuführen von Kühlflüssigkeit zum Spritzkopf und
 - (7) eine Einrichtung (91) zum Erwärmen des aufgeschmolzenen Gemisches, des lumenbildenden Fluidums und des Beschichtungsfluidums auf im wesentlichen die gleiche Temperatur.
- 20 28. Anlage nach Anspruch 27, mit einem zwischen dem Gefäß (90) und dem Spritzkopf vorgesehenen Filter (98).
29. Anlage nach Anspruch 27 oder 28, mit vier Spritzköpfen.
- 25

Revendications

1. Procédé de fabrication d'une fibre creuse poreuse polymère, comprenant les étapes de :
- a) chauffage d'un mélange (15) d'un polymère thermoplastique et d'un solvant à une température et pendant une durée assurant la dissolution mutuelle du polymère et du solvant,
 - 30 b) introduction du mélange fondu (15) dans une tête d'extrusion conçue pour façonner le mélange fondu en une fibre creuse,
 - c) introduction d'un fluide formant lumière (14) dans la lumière du mélange fondu façonné,
 - d) refroidissement du mélange fondu façonné dans la tête d'extrusion à une température telle que se produit une séparation de phases liquide-liquide hors d'équilibre pour former une matrice bicontinue de polymère et solvant dans laquelle le polymère et le solvant forment deux phases séparées entremêlées présentant une surface spécifique interfaciale importante et
 - 35 e) séparation du solvant du polymère, caractérisé par :
 - 40 f) l'introduction d'un fluide de revêtement (16) sur la surface externe du mélange fondu façonné et
 - g) l'introduction d'un fluide de refroidissement sur le fluide de revêtement.
2. Procédé selon la revendication 1, dans lequel la tête d'extrusion présente une première zone de température (17, 31) dans laquelle est façonnée la fibre et une seconde zone de température (18, 32) dans laquelle la fibre façonnée est refroidie et solidifiée.
- 45 3. Procédé selon la revendication 2, dans lequel le fluide formant lumière (14) et le fluide de revêtement (16) sont introduits dans la tête d'extrusion au niveau de la première zone de température (17, 31) et le fluide de refroidissement est introduit dans la tête d'extrusion au niveau de la seconde zone de température (18, 32).
- 50 4. Procédé selon l'une quelconque des revendications précédentes, dans lequel le diamètre de la fibre est diminué après le façonnage en forme de fibre creuse, le rapport du diamètre final de la fibre à celui du diamètre initial étant compris dans la plage de 0,25 à 10.
- 55 5. Procédé selon l'une quelconque des revendications précédentes, dans lequel la fibre se déplace à travers la tête d'extrusion à une vitesse linéaire différente de celle du fluide de refroidissement.

6. Procédé selon la revendication 5, dans lequel la fibre se déplace à une vitesse trois à quatre fois supérieure à la vitesse moyenne du fluide de refroidissement.
7. Procédé selon l'une quelconque des revendications précédentes, dans lequel le fluide formant lumière (14) est de l'azote gazeux ou de la vapeur saturée.
8. Procédé selon l'une quelconque des revendications précédentes, dans lequel le fluide de revêtement (16) est sélectionné dans le groupe comprenant huile de soja, huile de paraffine, huile d'arachides, huile de sésame, huile de boléko, huile de moutarde, huile d'olives, huile de polygala de Virginie, huile de coco, huile de café, huile de colza, huile de maïs, huile de coton, glycérol, trioléate de glycéryle, trimyristine, huile de jojoba, huile de Macassar, huile de margousier, huile de ricin, huile de racine d'iris et huile de carthame raffinée et acides oléique, palmitique, stéarique, arachidique, arachidonique, béhénique, lignocérique, linoléique, linoléénique, élaïdique, vaccénique et leurs glycérides et leurs mélanges avec leurs sels de sodium, de potassium et de calcium.
9. Procédé selon l'une quelconque des revendications précédentes, dans lequel le fluide de refroidissement est sélectionné dans le groupe comprenant huile de soja, eau, huile de paraffine, huile d'arachides, huile de sésame, huile de boléko, huile de moutarde, huile d'olives, huile de polygala de Virginie, huile de coco, huile de café, huile de colza, huile de maïs, huile de coton, glycérol, trioléate de glycéryle, trimyristine, huile de jojoba, huile de Macassar, huile de margousier, huile de ricin, huile de racine d'iris et huile de carthame raffinée et acides oléique, palmitique, stéarique, arachidique, arachidonique, béhénique, lignocérique, linoléique, linoléénique, élaïdique, vaccénique et leurs glycérides et leurs mélanges avec leurs sels de sodium, potassium et calcium.
10. Procédé selon la revendication 9, dans lequel le fluide de refroidissement est identique au fluide de revêtement (16).
11. Procédé selon la revendication 10, dans lequel le fluide formant lumière (14) est identique au fluide de revêtement (16) et au fluide de refroidissement.
12. Procédé selon la revendication 3, dans lequel le fluide formant lumière (14) et le fluide de revêtement (16) sont chauffés à la température du mélange fondu (15) avant d'être introduits dans la tête d'extrusion.
13. Procédé selon l'une quelconque des revendications précédentes, dans lequel le polymère est sélectionné dans le groupe comprenant polypropylène, polybutylène, poly(difluorure de vinylidène), poly(dichlorure de vinylidène), polyamide, poly(chlorure de vinyle), polystyrène, poly(méthacrylate de méthyle), polyphénylène-oxyde, polyéthylène-téréphtalate, polyacrylonitrile et acétate de cellulose.
14. Procédé selon l'une quelconque des revendications précédentes, dans lequel le solvant est sélectionné dans le groupe comprenant des tensioactifs cationiques, anioniques et non ioniques.
15. Procédé selon l'une quelconque des revendications précédentes, dans lequel le mélange formant la fibre comprend un antioxydant.
16. Procédé selon la revendication 15, dans lequel l'antioxydant est sélectionné dans le groupe comprenant le (1,3,5-triméthyl-2,4,6-tris-3,5-di-tert-butyl-4-hydroxybenzyl)benzène et un phénol non libre soluble.
17. Tête d'extrusion destinée à façonner une fibre creuse poreuse polymère, comprenant un corps allongé définissant un passage axial (11, 39) destiné à recevoir un fluide formant lumière (14), un premier passage annulaire (12, 48) autour du passage axial destiné à recevoir un mélange fondu (15) dont est fait la fibre creuse, un second passage annulaire (13, 53) se trouvant radialement à l'extérieur du premier passage annulaire (12, 48) et destiné à recevoir un fluide de revêtement (16) et un troisième passage annulaire (19) destiné à recevoir un fluide de refroidissement et un moyen (20) permettant de diriger le fluide de refroidissement vers la surface externe du fluide de revêtement.
18. Tête d'extrusion selon la revendication 17, dans laquelle le passage axial (11, 39), le premier passage annulaire (12, 48) et le second passage annulaire (13, 53) sont situés dans une première partie (31) de

la tête d'extrusion et le troisième passage annulaire (19) est situé dans une seconde partie (32) de la tête d'extrusion.

- 5 19. Tête d'extrusion selon la revendication 18, dans laquelle la tête d'extrusion possède un passage (68) reliant la première et la seconde partie (31, 32) et le troisième passage annulaire (53) se trouve radialement à l'extérieur du passage de liaison (68), le moyen de direction (69) étant intercalé.
- 10 20. Tête d'extrusion selon la revendication 17, dans laquelle le passage axial (39) se termine dans une filière (80) qui s'étend dans le premier passage annulaire (48).
21. Tête d'extrusion selon la revendication 20, dans laquelle la filière (80) possède une sur sa périphérie externe pluralité de parties en saillie (81) destinées à centrer la filière par rapport au premier passage annulaire (48).
- 15 22. Tête d'extrusion selon la revendication 17, dans laquelle le premier passage annulaire (48) se rétrécit vers l'intérieur en direction de l'axe de la tête d'extrusion.
23. Tête d'extrusion selon la revendication 22, dans laquelle le premier passage (48) présente une première partie conique (48a) et une seconde partie conique (48b), la première partie conique formant avec l'axe un angle supérieur à celui formé avec la seconde partie conique.
- 20 24. Tête d'extrusion selon la revendication 17, dans laquelle le passage axial (39) et le premier passage annulaire (48) se terminent au même emplacement à l'intérieur de la tête d'extrusion.
- 25 25. Tête d'extrusion selon l'une quelconque des revendications précédentes, dans laquelle le second passage annulaire présente une première partie (53) à section transversale constante et une seconde partie (54) qui se rétrécit en direction de l'axe du passage axial.
- 30 26. Tête d'extrusion selon l'une quelconque des revendications précédentes, dans laquelle le moyen de direction comprend un élément annulaire allongé (67) présentant un trou évasé (68), l'évasement augmentant vers l'extérieur par rapport à la direction de passage de la fibre à travers la tête d'extrusion.
- 35 27. Installation de façonnage d'une fibre creuse comprenant :
(i) un récipient (90) destiné à contenir un mélange fondu à partir duquel la fibre est façonnée,
(ii) une tête d'extrusion selon l'une quelconque des revendications 17 à 26,
(iii) des moyens (96, 94) destinés à transporter le mélange fondu à la tête d'extrusion,
(iv) des moyens (119, 39) destinés à alimenter la tête d'extrusion en fluide formant lumière,
(v) un moyen (36) destiné à alimenter la tête d'extrusion en fluide de revêtement de la fibre,
40 (vi) des moyens (114, 112) destinés à alimenter la tête d'extrusion en liquide de refroidissement et
(vii) un moyen (91) destiné à chauffer le mélange fondu, le fluide formant lumière et le fluide de revêtement à une température sensiblement identique.
- 45 28. Installation selon la revendication 27 et comprenant un filtre (98) entre le récipient (90) et la tête d'extrusion.
- 50 29. Installation selon la revendication 27 ou 28, et comprenant quatre têtes d'extrusion.
- 55
