

Abstract**Operation Object Processing Method and Apparatus**

An operation object processing method and apparatus. The method comprises: receiving touch position information generated based on multi-point touch operation; determining operation objects corresponding to the touch position information; determining a target object set corresponding to the operation objects; and merging the operation objects according to the target object set. By means of the method, a user does not need to perform operations of long-pressing, dragging and the like on operation objects, and especially for multiple operation objects, the user can conveniently merge the multiple operation objects into a target object set by means of multi-point pressing.
