

Abstract

Provided is an assembly method for a crane (1), by which method a crane including a strut can be assembled easily. The assembly method for the crane (1) includes a strut coupling step of coupling a base end of a strut (6), a cylinder connecting step of extending a cylinder unit (65) having one end (65S) supported by the strut (6), the cylinder unit (65) being capable of extending/contracting, to connect the other end (65T) of the cylinder unit (65) to the boom (4), a strut raising step of causing the cylinder unit (65) to contract to raise the strut (6), and a strut supporting step of stretching a stretching member, such as a rear side guy line (Gr) or a luffing cable (A), between a front end of the strut (6) and a base end of the boom (4) to support the strut (6) in a raised state.
