

ENTRANCE HANDRAIL AND SLIDE DOOR MECHANISM

ABSTRACT

An entrance handrail includes: a base portion provided proximal to an entrance opening of a vehicle so as to be turnable; a handrail body that extends from the base portion; and a rail portion that extends from the base portion and that holds a second end portion of a link arm such that the second end portion is slidable. A first end portion of the link arm is turnably attached to a slide door that is movable along an outer wall surface of the vehicle to open and close the entrance opening. The handrail body and the rail portion project outward of the vehicle when the slide door opens the entrance opening. The handrail body and the rail portion are disposed to extend along the slide door when the slide door closes the entrance opening.
