

BEAT THE HEAT with THE EXTRACTOR

Now you don't have to endure extreme heat,
when your car is parked in the sun.

Surely you would have on many occasions rushed to drive off because it is 'baking hot' inside the car – especially if you have left it in the hot afternoon sun. In Asia, the temperature inside a parked car can reach a high of 50-60°C in a very short time. This device beats the heat by using up to 4 Extractor fans to cool the interiors, it is effective and reliable!

Normal solar films claims to reflect up to 70% of the sun rays, (the maximum tinting approved by ROV), but the remaining 30% heat soon builds up inside the car. The longer it stays in the sun the hotter the interior gets. Here is where the Extractor can do what solar films cannot, and this is how it works-

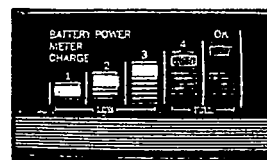

4 Extractor fans per set

The device works by extracting hot air inside a parked car, instead of reflecting the heat away. On reaching 35°C 2 powerful fans in the boot compartment force warm air through ventilation fins (present in all cars) out of the car. On cooling down the fans cut off.

If the temperature rises further, 2 additional fans fitted at the rear panel kick in to cope with the cooling. Hence you enjoy a cooler and more comfortable car to drive at all times of the day. The system effectively brings down the high interior temperature by 10-12°C.

The fans operate on an average of 3 to 4 hours daily, depending on how hot the weather is and where the car is parked. A separate Sealed Lead Battery powers the Extractor fans and is recharged during driving. The charge meter on the charger shows whether there is sufficient charge in the battery.

The system can be designed to fit most cars. See (left) picture of components and (above) an example of an installation in a BMW 318i saloon car.

Note; However it is best to have your car assessed first, for the installation cost may differ from car to car depending on the complexity of the job, averaging \$120/- for saloon cars
