ABSTRACT

A system for distributing contents to the terminals (23) of users through a network (22). Before the distribution, it is determined whether or not the contents can be distributed according to the information about the places to which the contents are distributed and the information about the places in which the contents are shown. Thus, a larger number of users can be provided with an opportunity to enjoy the contents without disordering the commercial domain of the showing movie theater for showing the contents.
