

INFORMATION MANAGEMENT SYSTEM

ABSTRACT

An information management system 10 stores, in a storage area, information specified in each of multiple types of agreements, which each define transfer of money, an article, or a right related to the money or article at a future time, in which the information is classified into basic information including the subject and period of an agreement, a flow condition specifying a condition for transfer of money, an article, or a right related to the money or article at a future time, and event information specifying an additional condition that affects the basic information or the flow condition. The information management system 10 receives basic information specified in each of the multiple types of agreements and input via an external device and stores basic information of each agreement in the storage area.
