

ABSTRACT

Implementations of the present application relate to an information generation method and apparatus, an information acquisition method and apparatus, an information processing method and apparatus, and a payment method and client. The
5 generation method includes: receiving an information generation instruction entered by a first user, where the information generation instruction includes at least two pieces of user identity information; combining the at least two pieces of user identity information in a predetermined method, to obtain continuous text information, where the at least two pieces of user identity information in the continuous text information
10 are separated by a separation string, and the separation string is a predefined character or character combination; and generating target information based on a predetermined algorithm and the continuous text information. Therefore, the target information can include at least two pieces of user identity information. This can improve efficiency of obtaining at least two pieces of user identity information when user identity
15 information is obtained by recognizing the target information, thereby improving efficiency of performing a service operation on at least two pieces of user identity information.
