

AIRFLOW ENVIRONMENT SYSTEM

ABSTRACT

Airflow environment system (1) according to the present disclosure includes suction port (6) that suctions the air in specific space (SP1, SP2), a purifier that purifies the air suctioned through suction port (6), discharge port (7) that discharges a part of the air purified by the purifier to an external space, release port (5) that releases a remaining part of the air purified by the purifier to specific space (SP1, SP2), as an airflow flowing in a specific direction along a backrest side of a pair of seats (3), and reflector (4) hit by the airflow flowing along the specific direction. Reflector (4) is configured to cause airflows released from release ports (5) to collide with each other, traverse between the pair of seats (3), and return to a floor side of the pair of seats (3).
