ABSTRACT

The present invention provides fully human antibodies that bind to either toxin A or toxin B of *Clostridium difficile*, or to both toxin A and toxin B, compositions comprising the antibodies and methods of use. The antibodies of the invention are useful for neutralizing the toxins from *C. difficile*, thus providing a means of treating the disease and symptoms associated with a *C. difficile* infection, including the treatment of diarrhea, or pseudomembranous colitis caused by *C. difficile*. The antibodies may also prevent the severity and/or duration of the primary disease, or may prevent the number, duration, and/or the severity of recurrences, or relapses of the disease attributed to the presence of *C. difficile*. The antibodies of the invention may also be useful for diagnosis of an infection by *C. difficile*.
